Let $\mathbf{F}$ be a continuous vector field on an open connected region R in $\mathbb{R}^2$. If $\int_C \mathbf{F} \cdot d\mathbf{r}$ is independent of path, then $\mathbf{F}$ is conservative; that is, there exists a potential function φ such that $\mathbf{F} = \nabla\varphi$ on R .

► We state and prove Theorem 17.5 in two variables. It is easily extended to three or more variables.

Proof: Let $P(a, b)$ and $Q(x, y)$ be interior points of R and define $\varphi(x, y) = \int_C \mathbf{F} \cdot d\mathbf{r}$,

where C is a piecewise-smooth path from P to Q , and $\mathbf{F} = \langle f, g \rangle$. Because the integral defining φ is independent of path, any piecewise-smooth path in R from P to Q can be used. The goal is to compute the directional derivative $D_{\mathbf{u}}\varphi(x, y)$, where $\mathbf{u} = \langle u_1, u_2 \rangle$ is an arbitrary unit vector, and then show that $\mathbf{F} = \nabla\varphi$. We let $S(x + tu_1, y + tu_2)$ be a point in R near Q and then apply the definition of the directional derivative at Q :

$$\begin{aligned} D_{\mathbf{u}}\varphi(x, y) &= \lim_{t \rightarrow 0} \frac{\varphi(x + tu_1, y + tu_2) - \varphi(x, y)}{t} \\ &= \lim_{t \rightarrow 0} \frac{1}{t} \left(\int_P^S \mathbf{F} \cdot d\mathbf{r} - \int_P^Q \mathbf{F} \cdot d\mathbf{r} \right) \\ &= \lim_{t \rightarrow 0} \frac{1}{t} \int_Q^S \mathbf{F} \cdot d\mathbf{r}. \end{aligned}$$

Using path independence, we choose the path from Q to S to be a line parameterized by $\mathbf{r}(s) = \langle x + su_1, y + su_2 \rangle$, for $0 \leq s \leq t$. Noting that $\mathbf{r}'(s) = \mathbf{u}$, the directional derivative is

$$\begin{aligned} D_{\mathbf{u}}\varphi(x, y) &= \lim_{t \rightarrow 0} \frac{1}{t} \int_Q^S \mathbf{F} \cdot d\mathbf{r} \\ &= \lim_{t \rightarrow 0} \frac{1}{t} \int_0^t \mathbf{F}(x + su_1, y + su_2) \cdot \mathbf{r}'(s) ds && \text{Change line integral to ordinary integral.} \\ &= \lim_{t \rightarrow 0} \frac{\int_0^t \mathbf{F}(x + su_1, y + su_2) \cdot \mathbf{r}'(s) ds - \int_0^0 \mathbf{F}(x + su_1, y + su_2) \cdot \mathbf{r}'(s) ds}{t} \\ &&& \text{Second integral equals 0.} \\ &= \frac{d}{dt} \int_0^t \mathbf{F}(x + su_1, y + su_2) \cdot \mathbf{u} ds \Big|_{t=0} && \text{Identify difference quotient; } \mathbf{r}'(s) = \mathbf{u} \\ &= \mathbf{F}(x, y) \cdot \mathbf{u}. && \text{Fundamental Theorem of Calculus} \end{aligned}$$

Choosing $\mathbf{u} = \mathbf{i} = \langle 1, 0 \rangle$, we see that $D_{\mathbf{i}}\varphi(x, y) = \varphi_x(x, y) = \mathbf{F}(x, y) \cdot \mathbf{i} = f(x, y)$. Similarly, choosing $\mathbf{u} = \mathbf{j} = \langle 0, 1 \rangle$, we have $D_{\mathbf{j}}\varphi(x, y) = \varphi_y(x, y) = \mathbf{F}(x, y) \cdot \mathbf{j} = g(x, y)$. Therefore, $\mathbf{F} = \langle f, g \rangle = \langle \varphi_x, \varphi_y \rangle = \nabla\varphi$, and $\mathbf{F}$ is conservative. 

EXAMPLE 3 Verifying path independence Consider the potential function $\varphi(x, y) = (x^2 - y^2)/2$ and its gradient field $\mathbf{F} = \langle x, -y \rangle$.

- Let C_1 be the quarter-circle $\mathbf{r}(t) = \langle \cos t, \sin t \rangle$, for $0 \leq t \leq \pi/2$, from $A(1, 0)$ to $B(0, 1)$.
- Let C_2 be the line $\mathbf{r}(t) = \langle 1 - t, t \rangle$, for $0 \leq t \leq 1$, also from A to B .

Evaluate the line integrals of $\mathbf{F}$ on C_1 and C_2 , and show that both are equal to $\varphi(B) - \varphi(A)$.

SOLUTION On C_1 , we have $\mathbf{r}'(t) = \langle -\sin t, \cos t \rangle$ and $\mathbf{F} = \langle x, -y \rangle = \langle \cos t, -\sin t \rangle$. The line integral on C_1 is

$$\begin{aligned} \int_{C_1} \mathbf{F} \cdot d\mathbf{r} &= \int_a^b \mathbf{F} \cdot \mathbf{r}'(t) dt \\ &= \int_0^{\pi/2} \underbrace{\langle \cos t, -\sin t \rangle}_{\mathbf{F}} \cdot \underbrace{\langle -\sin t, \cos t \rangle}_{\mathbf{r}'(t) dt} dt && \text{Substitute for } \mathbf{F} \text{ and } \mathbf{r}'. \\ &= \int_0^{\pi/2} (-\sin 2t) dt && 2 \sin t \cos t = \sin 2t \\ &= \left(\frac{1}{2} \cos 2t \right) \Big|_0^{\pi/2} = -1. && \text{Evaluate the integral.} \end{aligned}$$

On C_2 , we have $\mathbf{r}'(t) = \langle -1, 1 \rangle$ and $\mathbf{F} = \langle x, -y \rangle = \langle 1 - t, -t \rangle$; therefore,

$$\begin{aligned} \int_{C_2} \mathbf{F} \cdot d\mathbf{r} &= \int_0^1 \underbrace{\langle 1 - t, -t \rangle}_{\mathbf{F}} \cdot \underbrace{\langle -1, 1 \rangle}_{d\mathbf{r}} dt && \text{Substitute for } \mathbf{F} \text{ and } d\mathbf{r}. \\ &= \int_0^1 (-1) dt = -1. && \text{Simplify.} \end{aligned}$$

The two line integrals have the same value, which is

$$\varphi(B) - \varphi(A) = \varphi(0, 1) - \varphi(1, 0) = -\frac{1}{2} - \frac{1}{2} = -1.$$

Related Exercises 31–32 

EXAMPLE 4 Line integral of a conservative vector field Evaluate

$$\int_C ((2xy - z^2)\mathbf{i} + (x^2 + 2z)\mathbf{j} + (2y - 2xz)\mathbf{k}) \cdot d\mathbf{r},$$

where C is a simple curve from $A(-3, -2, -1)$ to $B(1, 2, 3)$.

SOLUTION This vector field is conservative and has a potential function $\varphi = x^2y - xz^2 + 2yz$ (Example 2). By the Fundamental Theorem for line integrals,

$$\begin{aligned} &\int_C ((2xy - z^2)\mathbf{i} + (x^2 + 2z)\mathbf{j} + (2y - 2xz)\mathbf{k}) \cdot d\mathbf{r} \\ &= \int_C \underbrace{\nabla(x^2y - xz^2 + 2yz)}_{\varphi} \cdot d\mathbf{r} \\ &= \varphi(1, 2, 3) - \varphi(-3, -2, -1) = 16. \end{aligned}$$

QUICK CHECK 4 Explain why the vector field $\nabla(xy + xz - yz)$ is conservative. 

Related Exercise 34 

► Notice the analogy to $\int_a^a f(x) dx = 0$, which is true of all integrable functions.

Figure 17.30

Line Integrals on Closed Curves

It is a short step to another characterization of conservative vector fields. Suppose C is a simple *closed* piecewise-smooth oriented curve in $\mathbb{R}^2$ or $\mathbb{R}^3$. To distinguish line integrals on closed curves, we adopt the notation $\oint_C \mathbf{F} \cdot d\mathbf{r}$, where the small circle on the integral sign indicates that C is a closed curve. Let A be any point on C and think of A as both the initial point and the final point of C . Assuming $\mathbf{F}$ is a conservative vector field on an open connected region R containing C , it follows by Theorem 17.4 that

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \varphi(A) - \varphi(A) = 0.$$

Because A is an arbitrary point on C , we see that the line integral of a conservative vector field on a closed curve is zero.

An argument can be made in the opposite direction as well: Suppose $\oint_C \mathbf{F} \cdot d\mathbf{r} = 0$ on all simple closed piecewise-smooth oriented curves in a region R , and let A and B be distinct points in R . Let C_1 denote any curve from A to B , let C_2 be any curve from B to A (distinct from and not intersecting C_1), and let C be the closed curve consisting of C_1 followed by C_2 (Figure 17.30). Then

$$0 = \oint_C \mathbf{F} \cdot d\mathbf{r} = \int_{C_1} \mathbf{F} \cdot d\mathbf{r} + \int_{C_2} \mathbf{F} \cdot d\mathbf{r}.$$

Therefore, $\int_{C_1} \mathbf{F} \cdot d\mathbf{r} = -\int_{C_2} \mathbf{F} \cdot d\mathbf{r} = \int_{-C_2} \mathbf{F} \cdot d\mathbf{r}$, where $-C_2$ is the curve C_2 traversed in the opposite direction (from A to B). We see that the line integral has the same value on two arbitrary paths between A and B . It follows that the value of the line integral is independent of path, and by Theorem 17.5, $\mathbf{F}$ is conservative. This argument is a proof of the following theorem.

THEOREM 17.6 Line Integrals on Closed Curves

Let R be an open connected region in $\mathbb{R}^2$ or $\mathbb{R}^3$. Then $\mathbf{F}$ is a conservative vector field on R if and only if $\oint_C \mathbf{F} \cdot d\mathbf{r} = 0$ on all simple closed piecewise-smooth oriented curves C in R .

EXAMPLE 5 A closed curve line integral in $\mathbb{R}^3$ Evaluate $\int_C \nabla(-xy + xz + yz) \cdot d\mathbf{r}$ on the curve $C: \mathbf{r}(t) = \langle \sin t, \cos t, \sin t \rangle$, for $0 \leq t \leq 2\pi$, without using Theorem 17.4 or Theorem 17.6.

SOLUTION The components of the vector field are

$$\mathbf{F} = \nabla(-xy + xz + yz) = \langle -y + z, -x + z, x + y \rangle.$$

Note that $\mathbf{r}'(t) = \langle \cos t, -\sin t, \cos t \rangle$ and $d\mathbf{r} = \mathbf{r}'(t) dt$. Substituting values of x , y , and z , the value of the line integral is

$$\begin{aligned} \oint_C \mathbf{F} \cdot d\mathbf{r} &= \oint_C \langle -y + z, -x + z, x + y \rangle \cdot d\mathbf{r} && \text{Substitute for } \mathbf{F}. \\ &= \int_0^{2\pi} \sin 2t \, dt && \text{Substitute for } x, y, z, d\mathbf{r}. \\ &= -\frac{1}{2} \cos 2t \Big|_0^{2\pi} = 0. && \text{Evaluate integral.} \end{aligned}$$

The line integral of this conservative vector field on the closed curve C is zero. In fact, by Theorem 17.6, the line integral vanishes on any simple closed piecewise-smooth oriented curve.

Related Exercise 50 ◀

Summary of the Properties of Conservative Vector Fields

We have established three equivalent properties of conservative vector fields $\mathbf{F}$ defined on an open connected region R in $\mathbb{R}^2$ (or D in $\mathbb{R}^3$).

- There exists a potential function φ such that $\mathbf{F} = \nabla\varphi$ (definition).
- $\int_C \mathbf{F} \cdot d\mathbf{r} = \varphi(B) - \varphi(A)$ for all points A and B in R and all piecewise-smooth oriented curves C in R from A to B (path independence).
- $\oint_C \mathbf{F} \cdot d\mathbf{r} = 0$ on all simple piecewise-smooth closed oriented curves C in R .

The connections between these properties were established by Theorems 17.4, 17.5, and 17.6 in the following way:

$$\text{Path independence} \xLeftrightarrow{\text{Theorems 17.4 and 17.5}} \mathbf{F} \text{ is conservative } (\nabla\varphi = \mathbf{F}) \xLeftrightarrow{\text{Theorem 17.6}} \oint_C \mathbf{F} \cdot d\mathbf{r} = 0.$$

SECTION 17.3 EXERCISES

Getting Started

1. Explain with pictures what is meant by a simple curve and a closed curve.
2. Explain with pictures what is meant by a connected region and a simply connected region.
3. How do you determine whether a vector field in $\mathbb{R}^2$ is conservative (has a potential function φ such that $\mathbf{F} = \nabla\varphi$)?
4. How do you determine whether a vector field in $\mathbb{R}^3$ is conservative?
5. Briefly describe how to find a potential function φ for a conservative vector field $\mathbf{F} = \langle f, g \rangle$.
6. If $\mathbf{F}$ is a conservative vector field on a region R , how do you evaluate $\int_C \mathbf{F} \cdot d\mathbf{r}$, where C is a path between two points A and B in R ?
7. If $\mathbf{F}$ is a conservative vector field on a region R , what is the value of $\oint_C \mathbf{F} \cdot d\mathbf{r}$, where C is a simple closed piecewise-smooth oriented curve in R ?
8. Give three equivalent properties of conservative vector fields.

Practice Exercises

9–16. Testing for conservative vector fields Determine whether the following vector fields are conservative (in $\mathbb{R}^2$ or $\mathbb{R}^3$).

9. $\mathbf{F} = \langle 1, 1 \rangle$
10. $\mathbf{F} = \langle x, y \rangle$
11. $\mathbf{F} = \langle -y, x \rangle$
12. $\mathbf{F} = \langle -y, x + y \rangle$
13. $\mathbf{F} = \langle e^{-x} \cos y, e^{-x} \sin y \rangle$
14. $\mathbf{F} = \langle 2x^3 + xy^2, 2y^3 - x^2y \rangle$
15. $\mathbf{F} = \langle yz \cos xz, \sin xz, xy \cos xz \rangle$
16. $\mathbf{F} = \langle ye^{x-z}, e^{x-z}, ye^{x-z} \rangle$

17–30. Finding potential functions Determine whether the following vector fields are conservative on the specified region. If so, determine a potential function. Let R^* and D^* be open regions of $\mathbb{R}^2$ and $\mathbb{R}^3$, respectively, that do not include the origin.

17. $\mathbf{F} = \langle x, y \rangle$ on $\mathbb{R}^2$
18. $\mathbf{F} = \langle -y, -x \rangle$ on $\mathbb{R}^2$
19. $\mathbf{F} = \left\langle x^3 - xy, \frac{x^2}{2} + y \right\rangle$ on $\mathbb{R}^2$
20. $\mathbf{F} = \frac{\langle x, y \rangle}{x^2 + y^2}$ on R^*
21. $\mathbf{F} = \frac{\langle x, y \rangle}{\sqrt{x^2 + y^2}}$ on R^*

22. $\mathbf{F} = \langle y, x, x - y \rangle$ on $\mathbb{R}^3$
23. $\mathbf{F} = \langle z, 1, x \rangle$ on $\mathbb{R}^3$
24. $\mathbf{F} = \langle yz, xz, xy \rangle$ on $\mathbb{R}^3$
25. $\mathbf{F} = \langle e^z, e^z, e^z(x - y) \rangle$ on $\mathbb{R}^3$
26. $\mathbf{F} = \langle 1, -z, y \rangle$ on $\mathbb{R}^3$
27. $\mathbf{F} = \langle y + z, x + z, x + y \rangle$ on $\mathbb{R}^3$
28. $\mathbf{F} = \frac{\langle x, y, z \rangle}{x^2 + y^2 + z^2}$ on D^*
29. $\mathbf{F} = \frac{\langle x, y, z \rangle}{\sqrt{x^2 + y^2 + z^2}}$ on D^*
30. $\mathbf{F} = \langle x^3, 2y, -z^3 \rangle$ on $\mathbb{R}^3$

31–34. Evaluating line integrals Use the given potential function φ of the gradient field $\mathbf{F}$ and the curve C to evaluate the line integral $\int_C \mathbf{F} \cdot d\mathbf{r}$ in two ways.

- a. Use a parametric description of C and evaluate the integral directly.
- b. Use the Fundamental Theorem for line integrals.

31. $\varphi(x, y) = xy$; $C: \mathbf{r}(t) = \langle \cos t, \sin t \rangle$, for $0 \leq t \leq \pi$
32. $\varphi(x, y) = x + 3y$; $C: \mathbf{r}(t) = \langle 2 - t, t \rangle$, for $0 \leq t \leq 2$
33. $\varphi(x, y, z) = (x^2 + y^2 + z^2)/2$; $C: \mathbf{r}(t) = \langle \cos t, \sin t, t/\pi \rangle$, for $0 \leq t \leq 2\pi$
34. $\varphi(x, y, z) = xy + xz + yz$; $C: \mathbf{r}(t) = \langle t, 2t, 3t \rangle$, for $0 \leq t \leq 4$

35–38. Applying the Fundamental Theorem for line integrals Suppose the vector field $\mathbf{F}$ is continuous on $\mathbb{R}^2$, $\mathbf{F} = \langle f, g \rangle = \nabla\varphi$, $\varphi(1, 2) = 7$, $\varphi(3, 6) = 10$, and $\varphi(6, 4) = 20$. Evaluate the following integrals for the given curve C , if possible.

35. $\int_C \mathbf{F} \cdot d\mathbf{r}$; $C: \mathbf{r}(t) = \langle 2t - 1, t^2 + t \rangle$, for $1 \leq t \leq 2$
36. $\int_C \mathbf{F} \cdot \mathbf{T} ds$; C is a smooth curve from $(1, 2)$ to $(6, 4)$.
37. $\int_C f dx + g dy$; C is the path consisting of the line segment from $A(6, 4)$ to $B(1, 2)$ followed by the line segment from $B(1, 2)$ to $C(3, 6)$.
38. $\oint_C \mathbf{F} \cdot d\mathbf{r}$; C is a circle, oriented clockwise, starting and ending at the point $A(6, 4)$.

39–44. Using the Fundamental Theorem for line integrals Verify that the Fundamental Theorem for line integrals can be used to evaluate the given integral, and then evaluate the integral.

39. $\int_C \langle 2x, 2y \rangle \cdot d\mathbf{r}$, where C is a smooth curve from $(0, 1)$ to $(3, 4)$

40. $\int_C \langle 1, 1, 1 \rangle \cdot d\mathbf{r}$, where C is a smooth curve from $(1, -1, 2)$ to $(3, 0, 7)$

41. $\int_C \nabla(e^{-x} \cos y) \cdot d\mathbf{r}$, where C is the line segment from $(0, 0)$ to $(\ln 2, 2\pi)$

42. $\int_C \nabla(1 + x^2 y z) \cdot d\mathbf{r}$, where C is the helix $\mathbf{r}(t) = \langle \cos 2t, \sin 2t, t \rangle$, for $0 \leq t \leq 4\pi$

43. $\int_C \cos(2y - z) dx - 2x \sin(2y - z) dy + x \sin(2y - z) dz$, where C is the curve $\mathbf{r}(t) = \langle t^2, t, t \rangle$, for $0 \leq t \leq \pi$

44. $\int_C e^x y dx + e^x dy$, where C is the parabola $\mathbf{r}(t) = \langle t + 1, t^2 \rangle$, for $-1 \leq t \leq 3$

45–50. Line integrals of vector fields on closed curves Evaluate $\oint_C \mathbf{F} \cdot d\mathbf{r}$ for the following vector fields and closed oriented curves C by parameterizing C . If the integral is not zero, give an explanation.

45. $\mathbf{F} = \langle x, y \rangle$; C is the circle of radius 4 centered at the origin oriented counterclockwise.

46. $\mathbf{F} = \langle y, x \rangle$; C is the circle of radius 8 centered at the origin oriented counterclockwise.

47. $\mathbf{F} = \langle x, y \rangle$; C is the triangle with vertices $(0, \pm 1)$ and $(1, 0)$ oriented counterclockwise.

48. $\mathbf{F} = \langle y, -x \rangle$; C is the circle of radius 3 centered at the origin oriented counterclockwise.

49. $\mathbf{F} = \langle x, y, z \rangle$; $C: \mathbf{r}(t) = \langle \cos t, \sin t, 2 \rangle$, for $0 \leq t \leq 2\pi$

50. $\mathbf{F} = \langle y - z, z - x, x - y \rangle$; $C: \mathbf{r}(t) = \langle \cos t, \sin t, \cos t \rangle$, for $0 \leq t \leq 2\pi$

51–52. Evaluating line integrals using level curves Suppose the vector field $\mathbf{F}$, whose potential function is φ , is continuous on $\mathbb{R}^2$. Use the curves C_1 and C_2 and level curves of φ (see figure) to evaluate the following line integrals.

51. $\int_{C_1} \mathbf{F} \cdot d\mathbf{r}$

52. $\int_{C_2} \mathbf{F} \cdot d\mathbf{r}$

53–56. Line integrals Evaluate the following line integrals using a method of your choice.

53. $\oint_C \mathbf{F} \cdot d\mathbf{r}$, where $\mathbf{F} = \langle 2xy + z^2, x^2, 2xz \rangle$ and C is the circle $\mathbf{r}(t) = \langle 3 \cos t, 4 \cos t, 5 \sin t \rangle$, for $0 \leq t \leq 2\pi$

54. $\oint_C e^{-x} (\cos y dx + \sin y dy)$, where C is the square with vertices $(\pm 1, \pm 1)$ oriented counterclockwise

55. $\int_C \nabla(\sin xy) \cdot d\mathbf{r}$, where C is the line segment from $(0, 0)$ to $(2, \pi/4)$

56. $\int_C x^3 dx + y^3 dy$, where C is the curve $\mathbf{r}(t) = \langle 1 + \sin t, \cos^2 t \rangle$, for $0 \leq t \leq \pi/2$

57. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

a. If $\mathbf{F} = \langle -y, x \rangle$ and C is the circle of radius 4 centered at $(1, 0)$ oriented counterclockwise, then $\oint_C \mathbf{F} \cdot d\mathbf{r} = 0$.

b. If $\mathbf{F} = \langle x, -y \rangle$ and C is the circle of radius 4 centered at $(1, 0)$ oriented counterclockwise, then $\oint_C \mathbf{F} \cdot d\mathbf{r} = 0$.

c. A constant vector field is conservative on $\mathbb{R}^2$.

d. The vector field $\mathbf{F} = \langle f(x), g(y) \rangle$ is conservative on $\mathbb{R}^2$ (assume f and g are defined for all real numbers).

e. Gradient fields are conservative.

58. Closed-curve integrals Evaluate $\oint_C ds$, $\oint_C dx$, and $\oint_C dy$, where C is the unit circle oriented counterclockwise.

59–62. Work in force fields Find the work required to move an object in the following force fields along a line segment between the given points. Check to see whether the force is conservative.

59. $\mathbf{F} = \langle x, 2 \rangle$ from $A(0, 0)$ to $B(2, 4)$

60. $\mathbf{F} = \langle x, y \rangle$ from $A(1, 1)$ to $B(3, -6)$

61. $\mathbf{F} = \langle x, y, z \rangle$ from $A(1, 2, 1)$ to $B(2, 4, 6)$

62. $\mathbf{F} = e^{x+y} \langle 1, 1, z \rangle$ from $A(0, 0, 0)$ to $B(-1, 2, -4)$

63. Suppose C is a circle centered at the origin in a vector field $\mathbf{F}$ (see figure).

a. If C is oriented counterclockwise, is $\oint_C \mathbf{F} \cdot d\mathbf{r}$ positive, negative, or zero?

b. If C is oriented clockwise, is $\oint_C \mathbf{F} \cdot d\mathbf{r}$ positive, negative, or zero?

c. Is $\mathbf{F}$ conservative in $\mathbb{R}^2$? Explain.

64. A vector field that is continuous in $\mathbb{R}^2$ is given (see figure). Is it conservative?

65. **Work by a constant force** Evaluate a line integral to show that the work done in moving an object from point A to point B in the presence of a constant force $\mathbf{F} = \langle a, b, c \rangle$ is $\mathbf{F} \cdot \overrightarrow{AB}$.

Explorations and Challenges

66. **Conservation of energy** Suppose an object with mass m moves in a region R in a conservative force field given by $\mathbf{F} = -\nabla\varphi$, where φ is a potential function in a region R . The motion of the object is governed by Newton's Second Law of Motion, $\mathbf{F} = m\mathbf{a}$, where $\mathbf{a}$ is the acceleration. Suppose the object moves from point A to point B in R .

- Show that the equation of motion is $m \frac{d\mathbf{v}}{dt} = -\nabla\varphi$.
- Show that $\frac{d\mathbf{v}}{dt} \cdot \mathbf{v} = \frac{1}{2} \frac{d}{dt} (\mathbf{v} \cdot \mathbf{v})$.
- Take the dot product of both sides of the equation in part (a) with $\mathbf{v}(t) = \mathbf{r}'(t)$ and integrate along a curve between A and B . Use part (b) and the fact that $\mathbf{F}$ is conservative to show that the total energy (kinetic plus potential) $\frac{1}{2} m |\mathbf{v}|^2 + \varphi$ is the same at A and B . Conclude that because A and B are arbitrary, energy is conserved in R .

67. **Gravitational potential** The gravitational force between two point masses M and m is

$$\mathbf{F} = GMm \frac{\mathbf{r}}{|\mathbf{r}|^3} = GMm \frac{\langle x, y, z \rangle}{(x^2 + y^2 + z^2)^{3/2}},$$

where G is the gravitational constant.

- Verify that this force field is conservative on any region excluding the origin.
- Find a potential function φ for this force field such that $\mathbf{F} = -\nabla\varphi$.
- Suppose the object with mass m is moved from a point A to a point B , where A is a distance r_1 from M , and B is a distance r_2 from M . Show that the work done in moving the object is $GMm \left(\frac{1}{r_2} - \frac{1}{r_1} \right)$.
- Does the work depend on the path between A and B ? Explain.

68. **Radial fields in $\mathbb{R}^3$ are conservative** Prove that the radial field $\mathbf{F} = \frac{\mathbf{r}}{|\mathbf{r}|^p}$, where $\mathbf{r} = \langle x, y, z \rangle$ and p is a real number, is conservative on any region not containing the origin. For what values of p is $\mathbf{F}$ conservative on a region that contains the origin?

69. **Rotation fields are usually not conservative**

- Prove that the rotation field $\mathbf{F} = \frac{\langle -y, x \rangle}{|\mathbf{r}|^p}$, where $\mathbf{r} = \langle x, y \rangle$, is not conservative for $p \neq 2$.
- For $p = 2$, show that $\mathbf{F}$ is conservative on any region not containing the origin.
- Find a potential function for $\mathbf{F}$ when $p = 2$.

70. **Linear and quadratic vector fields**

- For what values of a, b, c , and d is the field $\mathbf{F} = \langle ax + by, cx + dy \rangle$ conservative?
- For what values of a, b , and c is the field $\mathbf{F} = \langle ax^2 - by^2, cxy \rangle$ conservative?

71. **Alternative construction of potential functions in $\mathbb{R}^2$** Assume the vector field $\mathbf{F}$ is conservative on $\mathbb{R}^2$, so that the line integral $\int_C \mathbf{F} \cdot d\mathbf{r}$ is independent of path. Use the following procedure to construct a potential function φ for the vector field $\mathbf{F} = \langle f, g \rangle = \langle 2x - y, -x + 2y \rangle$.

- Let A be $(0, 0)$ and let B be an arbitrary point (x, y) . Define $\varphi(x, y)$ to be the work required to move an object from A to B , where $\varphi(A) = 0$. Let C_1 be the path from A to $(x, 0)$ to B , and let C_2 be the path from A to $(0, y)$ to B . Draw a picture.
- Evaluate $\int_{C_1} \mathbf{F} \cdot d\mathbf{r} = \int_{C_1} f dx + g dy$ and conclude that $\varphi(x, y) = x^2 - xy + y^2$.
- Verify that the same potential function is obtained by evaluating the line integral over C_2 .

72–75. Alternative construction of potential functions Use the procedure in Exercise 71 to construct potential functions for the following fields.

72. $\mathbf{F} = \langle -y, -x \rangle$

73. $\mathbf{F} = \langle x, y \rangle$

74. $\mathbf{F} = \frac{\mathbf{r}}{|\mathbf{r}|}$, where $\mathbf{r} = \langle x, y \rangle$

75. $\mathbf{F} = \langle 2x^3 + xy^2, 2y^3 + x^2y \rangle$

QUICK CHECK ANSWERS

- A figure-8 is closed but not simple; a torus is connected but not simply connected.
- The vector field is obtained by differentiating the potential function. So additive constants in the potential give the same vector field: $\nabla(\varphi + C) = \nabla\varphi$, where C is a constant.
- Show that $\nabla(e^x \cos y) = \langle e^x \cos y, -e^x \sin y \rangle$, which is the original vector field. A similar calculation may be done for part (b).
- The vector field $\nabla(xy + xz - yz)$ is the gradient of $xy + xz - yz$, so the vector field is conservative. ◀

17.4 Green's Theorem

The preceding section gave a version of the Fundamental Theorem of Calculus that applies to line integrals. In this and the remaining sections of the text, you will see additional extensions of the Fundamental Theorem that apply to regions in $\mathbb{R}^2$ and $\mathbb{R}^3$. All these fundamental theorems share a common feature. Part 2 of the Fundamental Theorem of Calculus (Chapter 5) says

$$\int_a^b \frac{df}{dx} dx = f(b) - f(a),$$

which relates the integral of $\frac{df}{dx}$ on an interval $[a, b]$ to the values of f on the boundary of $[a, b]$. The Fundamental Theorem for line integrals says

$$\int_C \nabla \varphi \cdot d\mathbf{r} = \varphi(B) - \varphi(A),$$

which relates the integral of $\nabla \varphi$ on a piecewise-smooth oriented curve C to the boundary values of φ . (The boundary consists of the two endpoints A and B .)

The subject of this section is Green's Theorem, which is another step in this progression. It relates the double integral of derivatives of a function over a region in $\mathbb{R}^2$ to function values on the boundary of that region.

Circulation Form of Green's Theorem

Throughout this section, unless otherwise stated, we assume curves in the plane are simple closed piecewise-smooth oriented curves. By a result called the *Jordan Curve Theorem*, such curves have a well-defined interior such that when the curve is traversed in the counterclockwise direction (viewed from above), the interior is on the left. With this orientation, there is a unique outward unit normal vector that points to the right (at points where the curve is smooth). We also assume curves in the plane lie in regions that are both connected and simply connected.

Suppose the vector field $\mathbf{F}$ is defined on a region R whose boundary is the closed curve C . As we have seen, the circulation $\oint_C \mathbf{F} \cdot d\mathbf{r}$ (Section 17.2) measures the net component of $\mathbf{F}$ in the direction tangent to C . It is easiest to visualize the circulation when $\mathbf{F}$ represents the velocity of a fluid moving in two dimensions. For example, let C be the unit circle with a counterclockwise orientation. The vector field $\mathbf{F} = \langle -y, x \rangle$ has a positive circulation of 2π on C (Section 17.2) because the vector field is everywhere tangent to C (Figure 17.31). A nonzero circulation on a closed curve says that the vector field must have some property *inside* the curve that produces the circulation. You can think of this property as a *net rotation*.

To visualize the rotation of a vector field, imagine a small paddle wheel, fixed at a point in the vector field, with its axis perpendicular to the xy -plane (Figure 17.31). The strength of the rotation at that point is seen in the speed at which the paddle wheel spins, and the direction of the rotation is the direction in which the paddle wheel spins. At a different point in the vector field, the paddle wheel will, in general, have a different speed and direction of rotation.

The first form of Green's Theorem relates the circulation on C to the double integral, over the region R , of a quantity that measures rotation at each point of R .

Figure 17.31

THEOREM 17.7 Green's Theorem—Circulation Form

Let C be a simple closed piecewise-smooth curve, oriented counterclockwise, that encloses a connected and simply connected region R in the plane. Assume $\mathbf{F} = \langle f, g \rangle$, where f and g have continuous first partial derivatives in R . Then

$$\underbrace{\oint_C \mathbf{F} \cdot d\mathbf{r}}_{\text{circulation}} = \underbrace{\oint_C f dx + g dy}_{\text{circulation}} = \iint_R \left(\frac{\partial g}{\partial x} - \frac{\partial f}{\partial y} \right) dA.$$

► The circulation form of Green's Theorem is also called the *tangential*, or *curl*, form.

The proof of a special case of the theorem is given at the end of this section. Notice that the two line integrals on the left side of Green's Theorem give the circulation of the vector field on C . The double integral on the right side involves the quantity $\frac{\partial g}{\partial x} - \frac{\partial f}{\partial y}$, which describes the rotation of the vector field *within* C that produces the circulation *on* C . This quantity is called the *two-dimensional curl* of the vector field.

Figure 17.32 illustrates how the curl measures the rotation of a particular vector field at a point P . If the horizontal component of the field decreases in the y -direction at P ($f_y < 0$) and the vertical component increases in the x -direction at P ($g_x > 0$), then $\frac{\partial g}{\partial x} - \frac{\partial f}{\partial y} > 0$, and the field has a counterclockwise rotation at P . The double integral in Green's Theorem computes the net rotation of the field throughout R . The theorem says that the net rotation throughout R equals the circulation on the boundary of R .

Figure 17.32

Green's Theorem has an important consequence when applied to a conservative vector field. Recall from Theorem 17.3 that if $\mathbf{F} = \langle f, g \rangle$ is conservative, then its components satisfy the condition $f_y = g_x$. If R is a region of $\mathbb{R}^2$ on which the conditions of Green's Theorem are satisfied, then for a conservative field, we have

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_R \underbrace{\left(\frac{\partial g}{\partial x} - \frac{\partial f}{\partial y} \right)}_0 dA = 0.$$

Green's Theorem confirms the fact (Theorem 17.6) that if $\mathbf{F}$ is a conservative vector field in a region, then the circulation $\oint_C \mathbf{F} \cdot d\mathbf{r}$ is zero on any simple closed curve in the region. A two-dimensional vector field $\mathbf{F} = \langle f, g \rangle$ for which $\frac{\partial g}{\partial x} - \frac{\partial f}{\partial y} = 0$ at all points of a region is said to be *irrotational*, because it produces zero circulation on closed curves in the region. Irrotational vector fields on simply connected regions in $\mathbb{R}^2$ are conservative.

DEFINITION Two-Dimensional Curl

The **two-dimensional curl** of the vector field $\mathbf{F} = \langle f, g \rangle$ is $\frac{\partial g}{\partial x} - \frac{\partial f}{\partial y}$. If the curl is zero throughout a region, the vector field is **irrotational** on that region.

Evaluating circulation integrals of conservative vector fields on closed curves is easy. The integral is always zero. Green's Theorem provides a way to evaluate circulation integrals for nonconservative vector fields.

QUICK CHECK 1 Compute $\frac{\partial g}{\partial x} - \frac{\partial f}{\partial y}$ for the radial vector field $\mathbf{F} = \langle x, y \rangle$. What does this tell you about the circulation on a simple closed curve? ◀

- In some cases, the rotation of a vector field is not obvious. For example, the parallel flow in a channel $\mathbf{F} = \langle 0, 1 - x^2 \rangle$, for $|x| \leq 1$, has a nonzero curl for $x \neq 0$. See Exercise 72.

EXAMPLE 1 Circulation of a rotation field Consider the rotation vector field $\mathbf{F} = \langle -y, x \rangle$ on the unit disk $R = \{(x, y): x^2 + y^2 \leq 1\}$ (Figure 17.31). In Example 6 of Section 17.2, we showed that $\oint_C \mathbf{F} \cdot d\mathbf{r} = 2\pi$, where C is the boundary of R oriented counterclockwise. Confirm this result using Green's Theorem.

SOLUTION Note that $f(x, y) = -y$ and $g(x, y) = x$; therefore, the curl of $\mathbf{F}$ is $\frac{\partial g}{\partial x} - \frac{\partial f}{\partial y} = 2$. By Green's Theorem,

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_R \underbrace{\left(\frac{\partial g}{\partial x} - \frac{\partial f}{\partial y} \right)}_2 dA = \iint_R 2 dA = 2 \times \text{area of } R = 2\pi.$$

The curl $\frac{\partial g}{\partial x} - \frac{\partial f}{\partial y}$ is nonzero on R , which results in a nonzero circulation on the boundary of R . Related Exercises 18, 20 ◀

Calculating Area by Green's Theorem A useful consequence of Green's Theorem arises with the vector fields $\mathbf{F} = \langle f, g \rangle = \langle 0, x \rangle$ and $\mathbf{F} = \langle f, g \rangle = \langle y, 0 \rangle$. In the first case, we have $g_x = 1$ and $f_y = 0$; therefore, by Green's Theorem,

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \oint_C \underbrace{x dy}_{\mathbf{F} \cdot d\mathbf{r}} = \iint_R \underbrace{1}_{\frac{\partial g}{\partial x} - \frac{\partial f}{\partial y} = 1} dA = \text{area of } R.$$

In the second case, $g_x = 0$ and $f_y = 1$, and Green's Theorem says

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \oint_C y dx = - \iint_R dA = -\text{area of } R.$$

These two results may also be combined in one statement to give the following theorem.

THEOREM 17.8 Area of a Plane Region by Line Integrals

Under the conditions of Green's Theorem, the area of a region R enclosed by a curve C is

$$\oint_C x dy = - \oint_C y dx = \frac{1}{2} \oint_C (x dy - y dx).$$

A remarkably simple calculation of the area of an ellipse follows from this result.

EXAMPLE 2 Area of an ellipse Find the area of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$.

SOLUTION An ellipse with counterclockwise orientation is described parametrically by $\mathbf{r}(t) = \langle x, y \rangle = \langle a \cos t, b \sin t \rangle$, for $0 \leq t \leq 2\pi$. Noting that $dx = -a \sin t dt$ and $dy = b \cos t dt$, we have

$$\begin{aligned} x dy - y dx &= (a \cos t)(b \cos t) dt - (b \sin t)(-a \sin t) dt \\ &= ab (\cos^2 t + \sin^2 t) dt \\ &= ab dt. \end{aligned}$$

Expressing the line integral as an ordinary integral with respect to t , the area of the ellipse is

$$\frac{1}{2} \oint_C \underbrace{(x dy - y dx)}_{ab dt} = \frac{ab}{2} \int_0^{2\pi} dt = \pi ab.$$

Related Exercises 22–23 ◀

Flux Form of Green's Theorem

Let C be a closed curve enclosing a region R in $\mathbb{R}^2$ and let $\mathbf{F}$ be a vector field defined on R . We assume C and R have the previously stated properties; specifically, C is oriented counterclockwise with an outward normal vector $\mathbf{n}$. Recall that the outward flux of $\mathbf{F}$ across C is $\oint_C \mathbf{F} \cdot \mathbf{n} \, ds$ (Section 17.2). The second form of Green's Theorem relates the flux across C to a property of the vector field within R that produces the flux.

► The flux form of Green's Theorem is also called the *normal*, or *divergence*, form.

► The two forms of Green's Theorem are related in the following way: Applying the circulation form of the theorem to $\mathbf{F} = \langle -g, f \rangle$ results in the flux form, and applying the flux form of the theorem to $\mathbf{F} = \langle g, -f \rangle$ results in the circulation form.

THEOREM 17.9 Green's Theorem—Flux Form

Let C be a simple closed piecewise-smooth curve, oriented counterclockwise, that encloses a connected and simply connected region R in the plane. Assume $\mathbf{F} = \langle f, g \rangle$, where f and g have continuous first partial derivatives in R . Then

$$\underbrace{\oint_C \mathbf{F} \cdot \mathbf{n} \, ds}_{\text{outward flux}} = \underbrace{\oint_C f \, dy - g \, dx}_{\text{outward flux}} = \iint_R \left(\frac{\partial f}{\partial x} + \frac{\partial g}{\partial y} \right) dA,$$

where $\mathbf{n}$ is the outward unit normal vector on the curve.

The two line integrals on the left side of Theorem 17.9 give the outward flux of the vector field across C . The double integral on the right side involves the quantity $\frac{\partial f}{\partial x} + \frac{\partial g}{\partial y}$, which is the property of the vector field that produces the flux across C . This quantity is called the *two-dimensional divergence*.

Figure 17.33 illustrates how the divergence measures the flux of a particular vector field at a point P . If $f_x > 0$ at P , it indicates an expansion of the vector field in the x -direction (if f_x is negative, it indicates a contraction). Similarly, if $g_y > 0$ at P , it indicates an expansion of the vector field in the y -direction. The combined effect of $f_x + g_y > 0$ at a point is a net outward flux across a small circle enclosing P .

Figure 17.33

If the divergence of $\mathbf{F}$ is zero throughout a region on which $\mathbf{F}$ satisfies the conditions of Theorem 17.9, then the outward flux across the boundary is zero. Vector fields with a zero divergence are said to be *source free*. If the divergence is positive throughout R , the outward flux across C is positive, meaning that the vector field acts as a *source* in R . If the divergence is negative throughout R , the outward flux across C is negative, meaning that the vector field acts as a *sink* in R .

QUICK CHECK 2 Compute $\frac{\partial f}{\partial x} + \frac{\partial g}{\partial y}$ for the rotation field $\mathbf{F} = \langle -y, x \rangle$. What does this tell you about the outward flux of $\mathbf{F}$ across a simple closed curve? ◀

DEFINITION Two-Dimensional Divergence

The **two-dimensional divergence** of the vector field $\mathbf{F} = \langle f, g \rangle$ is $\frac{\partial f}{\partial x} + \frac{\partial g}{\partial y}$. If the divergence is zero throughout a region, the vector field is **source free** on that region.

Figure 17.34

EXAMPLE 3 Outward flux of a radial field Use Green's Theorem to compute the outward flux of the radial field $\mathbf{F} = \langle x, y \rangle$ across the unit circle $C = \{(x, y): x^2 + y^2 = 1\}$ (Figure 17.34). Interpret the result.

SOLUTION We have already calculated the outward flux of the radial field across C as a line integral and found it to be 2π (Example 8, Section 17.2). Computing the outward flux using Green's Theorem, note that $f(x, y) = x$ and $g(x, y) = y$; therefore, the divergence of $\mathbf{F}$ is $\frac{\partial f}{\partial x} + \frac{\partial g}{\partial y} = 2$. By Green's Theorem, we have

$$\oint_C \mathbf{F} \cdot \mathbf{n} \, ds = \iint_R \underbrace{\left(\frac{\partial f}{\partial x} + \frac{\partial g}{\partial y} \right)}_2 dA = \iint_R 2 \, dA = 2 \times \text{area of } R = 2\pi.$$

The positive divergence on R results in an outward flux of the vector field across the boundary of R .

Related Exercise 27 ◀

As with the circulation form, the flux form of Green's Theorem can be used in either direction: to simplify line integrals or to simplify double integrals.

EXAMPLE 4 Line integral as a double integral Evaluate

$$\oint_C (4x^3 + \sin y^2) \, dy - (4y^3 + \cos x^2) \, dx,$$

where C is the boundary of the disk $R = \{(x, y): x^2 + y^2 \leq 4\}$ oriented counterclockwise.

SOLUTION Letting $f(x, y) = 4x^3 + \sin y^2$ and $g(x, y) = 4y^3 + \cos x^2$, Green's Theorem takes the form

$$\begin{aligned} & \oint_C \underbrace{(4x^3 + \sin y^2)}_f \, dy - \underbrace{(4y^3 + \cos x^2)}_g \, dx \\ &= \iint_R \underbrace{(12x^2)}_{f_x} + \underbrace{(12y^2)}_{g_y} \, dA && \text{Green's Theorem, flux form} \\ &= 12 \int_0^{2\pi} \int_0^2 \underbrace{r^2}_{dA} r \, dr \, d\theta && \text{Polar coordinates; } x^2 + y^2 = r^2 \\ &= 12 \int_0^{2\pi} \left. \frac{r^4}{4} \right|_0^2 d\theta && \text{Evaluate inner integral.} \\ &= 48 \int_0^{2\pi} d\theta = 96\pi. && \text{Evaluate outer integral.} \end{aligned}$$

Related Exercises 35–36 ◀

Circulation and Flux on More General Regions

Some ingenuity is required to extend both forms of Green's Theorem to more complicated regions. The next two examples illustrate Green's Theorem on two such regions: a half-annulus and a full annulus.

EXAMPLE 5 Circulation on a half-annulus Consider the vector field $\mathbf{F} = \langle y^2, x^2 \rangle$ on the half-annulus $R = \{(x, y): 1 \leq x^2 + y^2 \leq 9, y \geq 0\}$, whose boundary is C . Find the circulation on C , assuming it has the orientation shown in Figure 17.35.

SOLUTION The circulation on C is

$$\oint_C f \, dx + g \, dy = \oint_C y^2 \, dx + x^2 \, dy.$$

Figure 17.35

With the given orientation, the curve runs counterclockwise on the outer semicircle and clockwise on the inner semicircle. Identifying $f(x, y) = y^2$ and $g(x, y) = x^2$, the circulation form of Green's Theorem converts the line integral into a double integral. The double integral is most easily evaluated in polar coordinates using $x = r \cos \theta$ and $y = r \sin \theta$:

$$\begin{aligned}
 \oint_C \underbrace{y^2}_{f} dx + \underbrace{x^2}_{g} dy &= \iint_R (\underbrace{2x}_{g_x} - \underbrace{2y}_{f_y}) dA && \text{Green's Theorem, circulation form} \\
 &= 2 \int_0^\pi \int_1^3 (r \cos \theta - r \sin \theta) \underbrace{r dr d\theta}_{dA} && \text{Convert to polar coordinates.} \\
 &= 2 \int_0^\pi (\cos \theta - \sin \theta) \frac{r^3}{3} \Big|_1^3 d\theta && \text{Evaluate inner integral.} \\
 &= \frac{52}{3} \int_0^\pi (\cos \theta - \sin \theta) d\theta && \text{Simplify.} \\
 &= -\frac{104}{3}. && \text{Evaluate outer integral.}
 \end{aligned}$$

The vector field (Figure 17.35) suggests why the circulation is negative. The field is roughly *opposed* to the direction of C on the outer semicircle but roughly aligned with the direction of C on the inner semicircle. Because the outer semicircle is longer and the field has greater magnitudes on the outer curve than on the inner curve, the greater contribution to the circulation is negative.

Related Exercise 41 ◀

Figure 17.36

- Another way to deal with the flux across the annulus is to apply Green's Theorem to the entire disk $|r| \leq 2$ and compute the flux across the outer circle. Then apply Green's Theorem to the disk $|r| \leq 1$ and compute the flux across the inner circle. Note that the flux *out of* the inner disk is a flux *into* the annulus. Therefore, the difference of the two fluxes gives the net flux for the annulus.

EXAMPLE 6 Flux across the boundary of an annulus Find the outward flux of the vector field $\mathbf{F} = \langle xy^2, x^2y \rangle$ across the boundary of the annulus $R = \{(x, y): 1 \leq x^2 + y^2 \leq 4\}$, which, when expressed in polar coordinates, is the set $\{(r, \theta): 1 \leq r \leq 2, 0 \leq \theta \leq 2\pi\}$ (Figure 17.36).

SOLUTION Because the annulus R is not simply connected, Green's Theorem does not apply as stated in Theorem 17.9. This difficulty is overcome by defining the curve C shown in Figure 17.36, which is simple, closed, and piecewise smooth. The connecting links L_1 and L_2 below and above the x -axis are traversed in opposite directions. Letting L_1 and L_2 approach the x -axis, the contributions to the line integral cancel on L_1 and L_2 . Because of this cancellation, we take C to be the curve that runs counterclockwise on the outer boundary and clockwise on the inner boundary.

Using the flux form of Green's Theorem and converting to polar coordinates, we have

$$\begin{aligned}
 \oint_C \mathbf{F} \cdot \mathbf{n} \, ds &= \oint_C f \, dy - g \, dx = \oint_C \underbrace{xy^2}_{f_x} dy - \underbrace{x^2y}_{g_y} dx && \text{Substitute for } f \text{ and } g. \\
 &= \iint_R (\underbrace{y^2}_{f_x} + \underbrace{x^2}_{g_y}) dA && \text{Green's Theorem, flux form} \\
 &= \int_0^{2\pi} \int_1^2 (r^2) r \, dr \, d\theta && \text{Polar coordinates; } x^2 + y^2 = r^2 \\
 &= \int_0^{2\pi} \frac{r^4}{4} \Big|_1^2 d\theta && \text{Evaluate inner integral.} \\
 &= \frac{15}{4} \int_0^{2\pi} d\theta && \text{Simplify.} \\
 &= \frac{15\pi}{2}. && \text{Evaluate outer integral.}
 \end{aligned}$$

- Notice that the divergence of the vector field in Example 6 ($x^2 + y^2$) is positive on R , so we expect an outward flux across C .

- Potential function for $\mathbf{F} = \langle f, g \rangle$:

$$\varphi_x = f \quad \text{and} \quad \varphi_y = g$$

Stream function for $\mathbf{F} = \langle f, g \rangle$:

$$\psi_x = -g \quad \text{and} \quad \psi_y = f$$

QUICK CHECK 3 Show that

$\psi = \frac{1}{2}(y^2 - x^2)$ is a stream function for the vector field $\mathbf{F} = \langle y, x \rangle$. Show that $\mathbf{F}$ has zero divergence. ◀

- In fluid dynamics, velocity fields that are both conservative and source free are called *ideal flows*. They model fluids that are irrotational and incompressible.
- Methods for finding solutions of Laplace's equation are discussed in advanced mathematics courses.

Figure 17.36 shows the vector field and explains why the flux across C is positive. Because the field increases in magnitude moving away from the origin, the outward flux across the outer boundary is greater than the inward flux across the inner boundary. Hence, the net outward flux across C is positive.

Related Exercise 42 ◀

Stream Functions

We can now see a wonderful parallel between circulation properties (and conservative vector fields) and flux properties (and source-free fields). We need one more piece to complete the picture; it is the *stream function*, which plays the same role for source-free fields that the potential function plays for conservative fields.

Consider a two-dimensional vector field $\mathbf{F} = \langle f, g \rangle$ that is differentiable on a region R . A **stream function** for the vector field—if it exists—is a function ψ (pronounced *psigh* or *psee*) that satisfies

$$\frac{\partial \psi}{\partial y} = f, \quad \frac{\partial \psi}{\partial x} = -g.$$

If we compute the divergence of a vector field $\mathbf{F} = \langle f, g \rangle$ that has a stream function and use the fact that $\psi_{xy} = \psi_{yx}$, then

$$\frac{\partial f}{\partial x} + \frac{\partial g}{\partial y} = \frac{\partial}{\partial x} \left(\frac{\partial \psi}{\partial y} \right) + \frac{\partial}{\partial y} \left(-\frac{\partial \psi}{\partial x} \right) = 0.$$

$\underbrace{\hspace{10em}}_{\psi_{yx} = \psi_{xy}}$

We see that the existence of a stream function guarantees that the vector field has zero divergence or, equivalently, is source free. The converse is also true on simply connected regions of $\mathbb{R}^2$.

As discussed in Section 17.1, the level curves of a stream function are called flow curves or streamlines—and for good reason. It can be shown (Exercise 70) that the vector field $\mathbf{F}$ is everywhere tangent to the streamlines, which means that a graph of the streamlines shows the flow of the vector field. Finally, just as circulation integrals of a conservative vector field are independent of path, flux integrals of a source-free field are also independent of path (Exercise 69).

Vector fields that are both conservative and source free are quite interesting mathematically because they have both a potential function and a stream function. It can be shown that the level curves of the potential and stream functions form orthogonal families; that is, at each point of intersection, the line tangent to one level curve is orthogonal to the line tangent to the other level curve (equivalently, the gradient vector of one function is orthogonal to the gradient vector of the other function). Such vector fields have zero curl ($g_x - f_y = 0$) and zero divergence ($f_x + g_y = 0$). If we write the zero divergence condition in terms of the potential function φ , we find that

$$0 = f_x + g_y = \varphi_{xx} + \varphi_{yy}.$$

Writing the zero curl condition in terms of the stream function ψ , we find that

$$0 = g_x - f_y = -\psi_{xx} - \psi_{yy}.$$

We see that the potential function and the stream function both satisfy an important equation known as **Laplace's equation**:

$$\varphi_{xx} + \varphi_{yy} = 0 \quad \text{and} \quad \psi_{xx} + \psi_{yy} = 0.$$

Any function satisfying Laplace's equation can be used as a potential function or stream function for a conservative, source-free vector field. These vector fields are used in fluid dynamics, electrostatics, and other modeling applications.

Table 17.1 shows the parallel properties of conservative and source-free vector fields in two dimensions. We assume C is a simple piecewise-smooth oriented curve and either is closed or has endpoints A and B .

Table 17.1

Conservative Fields $\mathbf{F} = \langle f, g \rangle$	Source-Free Fields $\mathbf{F} = \langle f, g \rangle$
• $\text{curl} = \frac{\partial g}{\partial x} - \frac{\partial f}{\partial y} = 0$	• $\text{divergence} = \frac{\partial f}{\partial x} + \frac{\partial g}{\partial y} = 0$
• Potential function φ with $\mathbf{F} = \nabla \varphi$ or $f = \frac{\partial \varphi}{\partial x}, \quad g = \frac{\partial \varphi}{\partial y}$	• Stream function ψ with $f = \frac{\partial \psi}{\partial y}, \quad g = -\frac{\partial \psi}{\partial x}$
• Circulation $= \oint_C \mathbf{F} \cdot d\mathbf{r} = 0$ on all closed curves C .	• Flux $= \oint_C \mathbf{F} \cdot \mathbf{n} \, ds = 0$ on all closed curves C .
• Evaluation of line integral $\int_C \mathbf{F} \cdot d\mathbf{r} = \varphi(B) - \varphi(A)$	• Evaluation of line integral $\int_C \mathbf{F} \cdot \mathbf{n} \, ds = \psi(B) - \psi(A)$

With Green's Theorem in the picture, we may also give a concise summary of the various cases that arise with line integrals of both the circulation and flux types (Table 17.2).

	C closed	C not closed
F source free ($f = \psi_y, g = -\psi_x$)	$\oint_C \mathbf{F} \cdot \mathbf{n} \, ds = 0$	$\int_C \mathbf{F} \cdot \mathbf{n} \, ds = \psi(B) - \psi(A)$
F not source free	Green's Theorem $\oint_C \mathbf{F} \cdot \mathbf{n} \, ds = \iint_R (f_x + g_y) \, dA$	Direct evaluation $\int_C \mathbf{F} \cdot \mathbf{n} \, ds = \int_a^b (fy' - gx') \, dt$

Proof of Green's Theorem on Special Regions

The proof of Green's Theorem is straightforward when restricted to special regions. We consider regions R enclosed by a simple closed smooth curve C oriented in

► This restriction on R means that lines parallel to the coordinate axes intersect the boundary of R at most twice.

the counterclockwise direction, such that the region can be expressed in two ways (Figure 17.37):

- $R = \{(x, y): a \leq x \leq b, G_1(x) \leq y \leq G_2(x)\}$ or
- $R = \{(x, y): H_1(y) \leq x \leq H_2(y), c \leq y \leq d\}$.

Figure 17.37

Under these conditions, we prove the circulation form of Green's Theorem:

$$\oint_C f \, dx + g \, dy = \iint_R \left(\frac{\partial g}{\partial x} - \frac{\partial f}{\partial y} \right) dA.$$

Beginning with the term $\iint_R \frac{\partial f}{\partial y} dA$, we write this double integral as an iterated integral, where $G_1(x) \leq y \leq G_2(x)$ in the inner integral and $a \leq x \leq b$ in the outer integral (Figure 17.37a). The upper curve is labeled C_2 and the lower curve is labeled C_1 . Notice that the inner integral of $\frac{\partial f}{\partial y}$ with respect to y gives $f(x, y)$. Therefore, the first step of the double integration is

$$\begin{aligned} \iint_R \frac{\partial f}{\partial y} dA &= \int_a^b \int_{G_1(x)}^{G_2(x)} \frac{\partial f}{\partial y} dy \, dx && \text{Convert to an iterated integral.} \\ &= \int_a^b \left(\underbrace{f(x, G_2(x))}_{\text{on } C_2} - \underbrace{f(x, G_1(x))}_{\text{on } C_1} \right) dx. \end{aligned}$$

Over the interval $a \leq x \leq b$, the points $(x, G_2(x))$ trace out the upper part of C (labeled C_2) in the *negative* (clockwise) direction. Similarly, over the interval $a \leq x \leq b$, the points $(x, G_1(x))$ trace out the lower part of C (labeled C_1) in the *positive* (counterclockwise) direction.

Therefore,

$$\begin{aligned} \iint_R \frac{\partial f}{\partial y} dA &= \int_a^b (f(x, G_2(x)) - f(x, G_1(x))) \, dx \\ &= \int_{-C_2} f \, dx - \int_{C_1} f \, dx \\ &= - \int_{C_2} f \, dx - \int_{C_1} f \, dx && \int_{-C_2} f \, dx = - \int_{C_2} f \, dx \\ &= - \oint_C f \, dx. && \int_C f \, dx = \int_{C_1} f \, dx + \int_{C_2} f \, dx \end{aligned}$$

A similar argument applies to the double integral of $\frac{\partial g}{\partial x}$, except we use the bounding curves $x = H_1(y)$ and $x = H_2(y)$, where C_1 is now the left curve and C_2 is the right curve (Figure 17.37b). We have

$$\begin{aligned}
 \iint_R \frac{\partial g}{\partial x} dA &= \int_c^d \int_{H_1(y)}^{H_2(y)} \frac{\partial g}{\partial x} dx dy && \text{Convert to an iterated integral.} \\
 &= \int_c^d \left(\underbrace{g(H_2(y), y)}_{C_2} - \underbrace{g(H_1(y), y)}_{-C_1} \right) dy \int \frac{\partial g}{\partial x} dx = g \\
 &= \int_{C_2} g dy - \int_{-C_1} g dy \\
 &= \int_{C_2} g dy + \int_{C_1} g dy && \int_{-C_1} g dy = - \int_{C_1} g dy \\
 &= \oint_C g dy. && \int_C g dy = \int_{C_1} g dy + \int_{C_2} g dy
 \end{aligned}$$

Combining these two calculations results in

$$\iint_R \left(\frac{\partial g}{\partial x} - \frac{\partial f}{\partial y} \right) dA = \oint_C f dx + g dy.$$

QUICK CHECK 4 Explain why Green's Theorem proves that if $g_x = f_y$, then the vector field $\mathbf{F} = \langle f, g \rangle$ is conservative. ◀

As mentioned earlier, with a change of notation (replace g with f and f with $-g$), the flux form of Green's Theorem is obtained. This proof also completes the list of equivalent properties of conservative fields given in Section 17.3: From Green's Theorem, it follows that if $\frac{\partial g}{\partial x} = \frac{\partial f}{\partial y}$ on a simply connected region R , then the vector field $\mathbf{F} = \langle f, g \rangle$ is conservative on R .

SECTION 17.4 EXERCISES

Getting Started

- Explain why the two forms of Green's Theorem are analogs of the Fundamental Theorem of Calculus.
- Referring to both forms of Green's Theorem, match each idea in Column 1 to an idea in Column 2:

Line integral for flux	Double integral of the curl
Line integral for circulation	Double integral of the divergence

- How do you use a line integral to compute the area of a plane region?
- Why does a two-dimensional vector field with zero curl on a region have zero circulation on a closed curve that bounds the region?
- Why does a two-dimensional vector field with zero divergence on a region have zero outward flux across a closed curve that bounds the region?
- Sketch a two-dimensional vector field that has zero curl everywhere in the plane.
- Sketch a two-dimensional vector field that has zero divergence everywhere in the plane.
- Discuss one of the parallels between a conservative vector field and a source-free vector field.

9–14. Assume C is a circle centered at the origin, oriented counterclockwise, that encloses disk R in the plane. Complete the following steps for each vector field $\mathbf{F}$.

- Calculate the two-dimensional curl of $\mathbf{F}$.
- Calculate the two-dimensional divergence of $\mathbf{F}$.
- Is $\mathbf{F}$ irrotational on R ?
- Is $\mathbf{F}$ source free on R ?

9. $\mathbf{F} = \langle x, y \rangle$

10. $\mathbf{F} = \langle y, -x \rangle$

11. $\mathbf{F} = \langle y, -3x \rangle$

12. $\mathbf{F} = \langle x^2 + 2xy, -2xy - y^2 \rangle$

13. $\mathbf{F} = \langle 4x^3y, xy^2 + x^4 \rangle$

14. $\mathbf{F} = \langle 4x^3 + y, 12xy \rangle$

- 15.** Suppose C is the boundary of region $R = \{(x, y) : x^2 \leq y \leq x \leq 1\}$, oriented counterclockwise (see figure); let $\mathbf{F} = \langle 1, x \rangle$.

- a. Compute the two-dimensional curl of $\mathbf{F}$ and determine whether $\mathbf{F}$ is irrotational.
- b. Find parameterizations $\mathbf{r}_1(t)$ and $\mathbf{r}_2(t)$ for C_1 and C_2 , respectively.
- c. Evaluate both the line integral and the double integral in the circulation form of Green's Theorem and check for consistency.
- d. Compute the two-dimensional divergence of $\mathbf{F}$ and use the flux form of Green's Theorem to explain why the outward flux is 0.
16. Suppose C is the boundary of region $R = \{(x, y): 2x^2 - 2x \leq y \leq 0\}$, oriented counterclockwise (see figure); let $\mathbf{F} = \langle x, 1 \rangle$.

- a. Compute the two-dimensional curl of $\mathbf{F}$ and use the circulation form of Green's Theorem to explain why the circulation is 0.
- b. Compute the two-dimensional divergence of $\mathbf{F}$ and determine whether $\mathbf{F}$ is source free.
- c. Find parameterizations $\mathbf{r}_1(t)$ and $\mathbf{r}_2(t)$ for C_1 and C_2 , respectively.
- d. Evaluate both the line integral and the double integral in the flux form of Green's Theorem and check for consistency.

Practice Exercises

17–20. Green's Theorem, circulation form Consider the following regions R and vector fields $\mathbf{F}$.

- a. Compute the two-dimensional curl of the vector field.
- b. Evaluate both integrals in Green's Theorem and check for consistency.
17. $\mathbf{F} = \langle 2y, -2x \rangle$; R is the region bounded by $y = \sin x$ and $y = 0$, for $0 \leq x \leq \pi$.
18. $\mathbf{F} = \langle -3y, 3x \rangle$; R is the triangle with vertices $(0, 0)$, $(1, 0)$, and $(0, 2)$.
19. $\mathbf{F} = \langle -2xy, x^2 \rangle$; R is the region bounded by $y = x(2 - x)$ and $y = 0$.
20. $\mathbf{F} = \langle 0, x^2 + y^2 \rangle$; $R = \{(x, y): x^2 + y^2 \leq 1\}$

21–26. Area of regions Use a line integral on the boundary to find the area of the following regions.

21. A disk of radius 5
22. A region bounded by an ellipse with major and minor axes of lengths 12 and 8, respectively
23. $\{(x, y): x^2 + y^2 \leq 16\}$
24. The region shown in the figure

25. The region bounded by the parabolas $\mathbf{r}(t) = \langle t, 2t^2 \rangle$ and $\mathbf{r}(t) = \langle t, 12 - t^2 \rangle$, for $-2 \leq t \leq 2$
26. The region bounded by the curve $\mathbf{r}(t) = \langle t(1 - t^2), 1 - t^2 \rangle$, for $-1 \leq t \leq 1$ (Hint: Plot the curve.)

27–30. Green's Theorem, flux form Consider the following regions R and vector fields $\mathbf{F}$.

- a. Compute the two-dimensional divergence of the vector field.
- b. Evaluate both integrals in Green's Theorem and check for consistency.

27. $\mathbf{F} = \langle x, y \rangle$; $R = \{(x, y): x^2 + y^2 \leq 4\}$
28. $\mathbf{F} = \langle x, -3y \rangle$; R is the triangle with vertices $(0, 0)$, $(1, 2)$, and $(0, 2)$.
29. $\mathbf{F} = \langle 2xy, x^2 \rangle$; $R = \{(x, y): 0 \leq y \leq x(2 - x)\}$
30. $\mathbf{F} = \langle x^2 + y^2, 0 \rangle$; $R = \{(x, y): x^2 + y^2 \leq 1\}$

31–40. Line integrals Use Green's Theorem to evaluate the following line integrals. Assume all curves are oriented counterclockwise. A sketch is helpful.

31. $\oint_C \langle 3y + 1, 4x^2 + 3 \rangle \cdot d\mathbf{r}$, where C is the boundary of the rectangle with vertices $(0, 0)$, $(4, 0)$, $(4, 2)$, and $(0, 2)$
32. $\oint_C \langle \sin y, x \rangle \cdot d\mathbf{r}$, where C is the boundary of the triangle with vertices $(0, 0)$, $(\frac{\pi}{2}, 0)$, and $(\frac{\pi}{2}, \frac{\pi}{2})$
33. $\oint_C xe^y dx + x dy$, where C is the boundary of the region bounded by the curves $y = x^2$, $x = 2$, and the x -axis
34. $\oint_C \frac{1}{1 + y^2} dx + y dy$, where C is the boundary of the triangle with vertices $(0, 0)$, $(1, 0)$, and $(1, 1)$
35. $\oint_C (2x + e^{y^2}) dy - (4y^2 + e^{x^2}) dx$, where C is the boundary of the square with vertices $(0, 0)$, $(1, 0)$, $(1, 1)$, and $(0, 1)$
36. $\oint_C (2x - 3y) dy - (3x + 4y) dx$, where C is the unit circle
37. $\oint_C f dy - g dx$, where $\langle f, g \rangle = \langle 0, xy \rangle$ and C is the triangle with vertices $(0, 0)$, $(2, 0)$, and $(0, 4)$
38. $\oint_C f dy - g dx$, where $\langle f, g \rangle = \langle x^2, 2y^2 \rangle$ and C is the upper half of the unit circle and the line segment $-1 \leq x \leq 1$, oriented clockwise
39. The circulation line integral of $\mathbf{F} = \langle x^2 + y^2, 4x + y^3 \rangle$, where C is the boundary of $\{(x, y): 0 \leq y \leq \sin x, 0 \leq x \leq \pi\}$
40. The flux line integral of $\mathbf{F} = \langle e^{x-y}, e^{y-x} \rangle$, where C is the boundary of $\{(x, y): 0 \leq y \leq x, 0 \leq x \leq 1\}$

41–48. Circulation and flux For the following vector fields, compute (a) the circulation on, and (b) the outward flux across, the boundary of the given region. Assume boundary curves are oriented counterclockwise.

41. $\mathbf{F} = \langle x, y \rangle$; R is the half-annulus $\{(r, \theta): 1 \leq r \leq 2, 0 \leq \theta \leq \pi\}$.

42. $\mathbf{F} = \langle -y, x \rangle$; R is the annulus $\{(r, \theta): 1 \leq r \leq 3, 0 \leq \theta \leq 2\pi\}$.

43. $\mathbf{F} = \langle 2x + y, x - 4y \rangle$; R is the quarter-annulus $\{(r, \theta): 1 \leq r \leq 4, 0 \leq \theta \leq \pi/2\}$.

44. $\mathbf{F} = \langle x - y, -x + 2y \rangle$; R is the parallelogram $\{(x, y): 1 - x \leq y \leq 3 - x, 0 \leq x \leq 1\}$.

45. $\mathbf{F} = \nabla(\sqrt{x^2 + y^2})$; R is the half-annulus $\{(r, \theta): 1 \leq r \leq 3, 0 \leq \theta \leq \pi\}$.

46. $\mathbf{F} = \left\langle \ln(x^2 + y^2), \tan^{-1} \frac{y}{x} \right\rangle$; R is the eighth-annulus $\{(r, \theta): 1 \leq r \leq 2, 0 \leq \theta \leq \pi/4\}$.

47. $\mathbf{F} = \langle x + y^2, x^2 - y \rangle$; $R = \{(x, y): y^2 \leq x \leq 2 - y^2\}$.

48. $\mathbf{F} = \langle y \cos x, -\sin x \rangle$; R is the square $\{(x, y): 0 \leq x \leq \pi/2, 0 \leq y \leq \pi/2\}$.

49. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- The work required to move an object around a closed curve C in the presence of a vector force field is the circulation of the force field on the curve.
- If a vector field has zero divergence throughout a region (on which the conditions of Green's Theorem are met), then the circulation on the boundary of that region is zero.
- If the two-dimensional curl of a vector field is positive throughout a region (on which the conditions of Green's Theorem are met), then the circulation on the boundary of that region is positive (assuming counterclockwise orientation).

50–51. Special line integrals Prove the following identities, where C is a simple closed smooth oriented curve.

50. $\oint_C dx = \oint_C dy = 0$

51. $\oint_C f(x) dx + g(y) dy = 0$, where f and g have continuous derivatives on the region enclosed by C

52. Double integral to line integral Use the flux form of Green's Theorem to evaluate $\iint_R (2xy + 4y^3) dA$, where R is the triangle with vertices $(0, 0)$, $(1, 0)$, and $(0, 1)$.

53. Area line integral Show that the value of

$$\oint_C xy^2 dx + (x^2y + 2x) dy$$

depends only on the area of the region enclosed by C .

54. Area line integral In terms of the parameters a and b , how is the value of $\oint_C ay dx + bx dy$ related to the area of the region enclosed by C , assuming counterclockwise orientation of C ?

55–58. Stream function Recall that if the vector field $\mathbf{F} = \langle f, g \rangle$ is source free (zero divergence), then a stream function ψ exists such that $f = \psi_y$ and $g = -\psi_x$.

a. Verify that the given vector field has zero divergence.

b. Integrate the relations $f = \psi_y$ and $g = -\psi_x$ to find a stream function for the field.

55. $\mathbf{F} = \langle 4, 2 \rangle$

56. $\mathbf{F} = \langle y^2, x^2 \rangle$

57. $\mathbf{F} = \langle -e^{-x} \sin y, e^{-x} \cos y \rangle$

58. $\mathbf{F} = \langle x^2, -2xy \rangle$

Explorations and Challenges

59–62. Ideal flow A two-dimensional vector field describes *ideal flow* if it has both zero curl and zero divergence on a simply connected region.

- Verify that both the curl and the divergence of the given field are zero.
- Find a potential function φ and a stream function ψ for the field.
- Verify that φ and ψ satisfy Laplace's equation $\varphi_{xx} + \varphi_{yy} = \psi_{xx} + \psi_{yy} = 0$.

59. $\mathbf{F} = \langle e^x \cos y, -e^x \sin y \rangle$

60. $\mathbf{F} = \langle x^3 - 3xy^2, y^3 - 3x^2y \rangle$

61. $\mathbf{F} = \left\langle \tan^{-1} \frac{y}{x}, \frac{1}{2} \ln(x^2 + y^2) \right\rangle$, for $x > 0$

62. $\mathbf{F} = \frac{\langle x, y \rangle}{x^2 + y^2}$, for $x > 0, y > 0$

63. Flow in an ocean basin An idealized two-dimensional ocean is modeled by the square region $R = \left[-\frac{\pi}{2}, \frac{\pi}{2}\right] \times \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ with boundary C . Consider the stream function $\psi(x, y) = 4 \cos x \cos y$ defined on R (see figure).

- The horizontal (east-west) component of the velocity is $u = \psi_y$ and the vertical (north-south) component of the velocity is $v = -\psi_x$. Sketch a few representative velocity vectors and show that the flow is counterclockwise around the region.
- Is the velocity field source free? Explain.
- Is the velocity field irrotational? Explain.
- Let C be the boundary of R . Find the total outward flux across C .
- Find the circulation on C assuming counterclockwise orientation.

64. Green's Theorem as a Fundamental Theorem of Calculus

Show that if the circulation form of Green's

Theorem is applied to the vector field $\left\langle 0, \frac{f(x)}{c} \right\rangle$, where $c > 0$

and $R = \{(x, y): a \leq x \leq b, 0 \leq y \leq c\}$, then the result is the Fundamental Theorem of Calculus,

$$\int_a^b \frac{df}{dx} dx = f(b) - f(a).$$

- 65. Green's Theorem as a Fundamental Theorem of Calculus** Show that if the flux form of Green's Theorem is applied to the vector field $\left\langle \frac{f(x)}{c}, 0 \right\rangle$, where $c > 0$ and $R = \{(x, y): a \leq x \leq b, 0 \leq y \leq c\}$, then the result is the Fundamental Theorem of Calculus,

$$\int_a^b \frac{df}{dx} dx = f(b) - f(a).$$

- 66. What's wrong?** Consider the rotation field $\mathbf{F} = \frac{\langle -y, x \rangle}{x^2 + y^2}$.

- Verify that the two-dimensional curl of $\mathbf{F}$ is zero, which suggests that the double integral in the circulation form of Green's Theorem is zero.
- Use a line integral to verify that the circulation on the unit circle of the vector field is 2π .
- Explain why the results of parts (a) and (b) do not agree.

- 67. What's wrong?** Consider the radial field $\mathbf{F} = \frac{\langle x, y \rangle}{x^2 + y^2}$.

- Verify that the divergence of $\mathbf{F}$ is zero, which suggests that the double integral in the flux form of Green's Theorem is zero.
- Use a line integral to verify that the outward flux across the unit circle of the vector field is 2π .
- Explain why the results of parts (a) and (b) do not agree.

- 68. Conditions for Green's Theorem** Consider the radial field

$$\mathbf{F} = \langle f, g \rangle = \frac{\langle x, y \rangle}{\sqrt{x^2 + y^2}} = \frac{\mathbf{r}}{|\mathbf{r}|}.$$

- Explain why the conditions of Green's Theorem do not apply to $\mathbf{F}$ on a region that includes the origin.
- Let R be the unit disk centered at the origin and compute $\iint_R \left(\frac{\partial f}{\partial x} + \frac{\partial g}{\partial y} \right) dA$.
- Evaluate the line integral in the flux form of Green's Theorem on the boundary of R .
- Do the results of parts (b) and (c) agree? Explain.

- 69. Flux integrals** Assume the vector field $\mathbf{F} = \langle f, g \rangle$ is source free (zero divergence) with stream function ψ . Let C be any smooth simple curve from A to the distinct point B . Show that the flux integral $\int_C \mathbf{F} \cdot \mathbf{n} ds$ is independent of path; that is, $\int_C \mathbf{F} \cdot \mathbf{n} ds = \psi(B) - \psi(A)$.

- 70. Streamlines are tangent to the vector field** Assume the vector field $\mathbf{F} = \langle f, g \rangle$ is related to the stream function ψ by $\psi_y = f$ and $\psi_x = -g$ on a region R . Prove that at all points of R , the vector field is tangent to the streamlines (the level curves of the stream function).

- 71. Streamlines and equipotential lines** Assume that on $\mathbb{R}^2$, the vector field $\mathbf{F} = \langle f, g \rangle$ has a potential function φ such that $f = \varphi_x$ and $g = \varphi_y$, and it has a stream function ψ such that $f = \psi_y$ and $g = -\psi_x$. Show that the equipotential curves (level curves of φ) and the streamlines (level curves of ψ) are everywhere orthogonal.

- 72. Channel flow** The flow in a long shallow channel is modeled by the velocity field $\mathbf{F} = \langle 0, 1 - x^2 \rangle$, where $R = \{(x, y): |x| \leq 1 \text{ and } |y| < 5\}$.

- Sketch R and several streamlines of $\mathbf{F}$.
- Evaluate the curl of $\mathbf{F}$ on the lines $x = 0$, $x = 1/4$, $x = 1/2$, and $x = 1$.
- Compute the circulation on the boundary of the region R .
- How do you explain the fact that the curl of $\mathbf{F}$ is nonzero at points of R , but the circulation is zero?

QUICK CHECK ANSWERS

1. $g_x - f_y = 0$, which implies zero circulation on a closed curve. 2. $f_x + g_y = 0$, which implies zero flux across a closed curve. 3. $\psi_y = y$ is the x -component of $\mathbf{F} = \langle y, x \rangle$, and $-\psi_x = x$ is the y -component of $\mathbf{F}$. Also, the divergence of $\mathbf{F}$ is $y_x + x_y = 0$. 4. If the curl is zero on a region, then all closed-path integrals are zero, which is a condition (Section 17.3) for a conservative field. ◀

17.5 Divergence and Curl

Green's Theorem sets the stage for the final act in our exploration of calculus. The last four sections of this chapter have the following goal: to lift both forms of Green's Theorem out of the plane ($\mathbb{R}^2$) and into space ($\mathbb{R}^3$). It is done as follows.

- The circulation form of Green's Theorem relates a line integral over a simple closed oriented curve in the plane to a double integral over the enclosed region. In an analogous manner, we will see that *Stokes' Theorem* (Section 17.7) relates a line integral over a simple closed oriented curve in $\mathbb{R}^3$ to a double integral over a surface whose boundary is that curve.
- The flux form of Green's Theorem relates a line integral over a simple closed oriented curve in the plane to a double integral over the enclosed region. Similarly, the *Divergence Theorem* (Section 17.8) relates an integral over a closed oriented surface in $\mathbb{R}^3$ to a triple integral over the region enclosed by that surface.

In order to make these extensions, we need a few more tools.

- The two-dimensional divergence and two-dimensional curl must be extended to three dimensions (this section).
- The idea of a *surface integral* must be introduced (Section 17.6).

► Review: The divergence measures the expansion or contraction of a vector field at each point. The flux form of Green's Theorem implies that if the two-dimensional divergence of a vector field is zero throughout a simply connected plane region, then the outward flux across the boundary of the region is zero. If the divergence is nonzero, Green's Theorem gives the outward flux across the boundary.

► In evaluating $\nabla \cdot \mathbf{F}$ as a dot product, each component of ∇ is applied to the corresponding component of $\mathbf{F}$, producing $f_x + g_y + h_z$.

$\nabla \cdot \mathbf{F} = 3$ at all points $\Rightarrow$ vector field expands outward at all points.

(a)

(b)

Figure 17.38

The Divergence

Recall that in two dimensions, the divergence of the vector field $\mathbf{F} = \langle f, g \rangle$ is $\frac{\partial f}{\partial x} + \frac{\partial g}{\partial y}$.

The extension to three dimensions is straightforward. If $\mathbf{F} = \langle f, g, h \rangle$ is a differentiable vector field defined on a region of $\mathbb{R}^3$, the divergence of $\mathbf{F}$ is $\frac{\partial f}{\partial x} + \frac{\partial g}{\partial y} + \frac{\partial h}{\partial z}$. The interpretation of the three-dimensional divergence is much the same as it is in two dimensions. It measures the expansion or contraction of the vector field at each point. If the divergence is zero at all points of a region, the vector field is *source free* on that region.

Recall the *del operator* ∇ that was introduced in Section 15.5 to define the gradient:

$$\nabla = \mathbf{i} \frac{\partial}{\partial x} + \mathbf{j} \frac{\partial}{\partial y} + \mathbf{k} \frac{\partial}{\partial z} = \left\langle \frac{\partial}{\partial x}, \frac{\partial}{\partial y}, \frac{\partial}{\partial z} \right\rangle.$$

This object is not really a vector; it is an operation that is applied to a function or a vector field. Applying it directly to a scalar function f results in the gradient of f :

$$\nabla f = \frac{\partial f}{\partial x} \mathbf{i} + \frac{\partial f}{\partial y} \mathbf{j} + \frac{\partial f}{\partial z} \mathbf{k} = \langle f_x, f_y, f_z \rangle.$$

However, if we form the *dot product* of ∇ and a vector field $\mathbf{F} = \langle f, g, h \rangle$, the result is

$$\nabla \cdot \mathbf{F} = \left\langle \frac{\partial}{\partial x}, \frac{\partial}{\partial y}, \frac{\partial}{\partial z} \right\rangle \cdot \langle f, g, h \rangle = \frac{\partial f}{\partial x} + \frac{\partial g}{\partial y} + \frac{\partial h}{\partial z},$$

which is the divergence of $\mathbf{F}$, also denoted $\text{div } \mathbf{F}$. Like all dot products, the divergence is a scalar; in this case, it is a scalar-valued function.

DEFINITION Divergence of a Vector Field

The **divergence** of a vector field $\mathbf{F} = \langle f, g, h \rangle$ that is differentiable on a region of $\mathbb{R}^3$ is

$$\text{div } \mathbf{F} = \nabla \cdot \mathbf{F} = \frac{\partial f}{\partial x} + \frac{\partial g}{\partial y} + \frac{\partial h}{\partial z}.$$

If $\nabla \cdot \mathbf{F} = 0$, the vector field is **source free**.

EXAMPLE 1 Computing the divergence Compute the divergence of the following vector fields.

- $\mathbf{F} = \langle x, y, z \rangle$ (a radial field)
- $\mathbf{F} = \langle -y, x - z, y \rangle$ (a rotation field)
- $\mathbf{F} = \langle -y, x, z \rangle$ (a spiral flow)

SOLUTION

- The divergence is $\nabla \cdot \mathbf{F} = \nabla \cdot \langle x, y, z \rangle = \frac{\partial x}{\partial x} + \frac{\partial y}{\partial y} + \frac{\partial z}{\partial z} = 1 + 1 + 1 = 3$.

Because the divergence is positive, the flow expands outward at all points (Figure 17.38a).

- The divergence is

$$\nabla \cdot \mathbf{F} = \nabla \cdot \langle -y, x - z, y \rangle = \frac{\partial(-y)}{\partial x} + \frac{\partial(x - z)}{\partial y} + \frac{\partial y}{\partial z} = 0 + 0 + 0 = 0,$$

so the field is source free.

- This field is a combination of the two-dimensional rotation field $\mathbf{F} = \langle -y, x \rangle$ and a vertical flow in the z -direction; the net effect is a field that spirals upward for $z > 0$ and spirals downward for $z < 0$ (Figure 17.38b). The divergence is

$$\nabla \cdot \mathbf{F} = \nabla \cdot \langle -y, x, z \rangle = \frac{\partial(-y)}{\partial x} + \frac{\partial x}{\partial y} + \frac{\partial z}{\partial z} = 0 + 0 + 1 = 1.$$

QUICK CHECK 1 Show that if a vector field has the form $\mathbf{F} = \langle f(y, z), g(x, z), h(x, y) \rangle$, then $\operatorname{div} \mathbf{F} = 0$. ◀

The rotational part of the field in x and y does not contribute to the divergence. However, the z -component of the field produces a nonzero divergence.

Related Exercises 10–11 ◀

Divergence of a Radial Vector Field The vector field considered in Example 1a is just one of many radial fields that have important applications (for example, the inverse square laws of gravitation and electrostatics). The following example leads to a general result for the divergence of radial vector fields.

EXAMPLE 2 Divergence of a radial field Compute the divergence of the radial vector field

$$\mathbf{F} = \frac{\mathbf{r}}{|\mathbf{r}|} = \frac{\langle x, y, z \rangle}{\sqrt{x^2 + y^2 + z^2}}.$$

SOLUTION This radial field has the property that it is directed outward from the origin and all vectors have unit length ($|\mathbf{F}| = 1$). Let's compute one piece of the divergence; the others follow the same pattern. Using the Quotient Rule, the derivative with respect to x of the first component of $\mathbf{F}$ is

$$\begin{aligned} \frac{\partial}{\partial x} \left(\frac{x}{(x^2 + y^2 + z^2)^{1/2}} \right) &= \frac{(x^2 + y^2 + z^2)^{1/2} - x^2 (x^2 + y^2 + z^2)^{-1/2}}{x^2 + y^2 + z^2} && \text{Quotient Rule} \\ &= \frac{|\mathbf{r}| - x^2 |\mathbf{r}|^{-1}}{|\mathbf{r}|^2} && \sqrt{x^2 + y^2 + z^2} = |\mathbf{r}| \\ &= \frac{|\mathbf{r}|^2 - x^2}{|\mathbf{r}|^3}. && \text{Simplify.} \end{aligned}$$

A similar calculation of the y - and z -derivatives yields $\frac{|\mathbf{r}|^2 - y^2}{|\mathbf{r}|^3}$ and $\frac{|\mathbf{r}|^2 - z^2}{|\mathbf{r}|^3}$, respectively. Adding the three terms, we find that

$$\begin{aligned} \nabla \cdot \mathbf{F} &= \frac{|\mathbf{r}|^2 - x^2}{|\mathbf{r}|^3} + \frac{|\mathbf{r}|^2 - y^2}{|\mathbf{r}|^3} + \frac{|\mathbf{r}|^2 - z^2}{|\mathbf{r}|^3} \\ &= 3 \frac{|\mathbf{r}|^2}{|\mathbf{r}|^3} - \frac{x^2 + y^2 + z^2}{|\mathbf{r}|^3} && \text{Collect terms.} \\ &= \frac{2}{|\mathbf{r}|}. && x^2 + y^2 + z^2 = |\mathbf{r}|^2 \end{aligned}$$

Related Exercise 18 ◀

Examples 1a and 2 give two special cases of the following theorem about the divergence of radial vector fields (Exercise 73).

THEOREM 17.10 Divergence of Radial Vector Fields

For a real number p , the divergence of the radial vector field

$$\mathbf{F} = \frac{\mathbf{r}}{|\mathbf{r}|^p} = \frac{\langle x, y, z \rangle}{(x^2 + y^2 + z^2)^{p/2}} \quad \text{is} \quad \nabla \cdot \mathbf{F} = \frac{3 - p}{|\mathbf{r}|^p}.$$

EXAMPLE 3 Divergence from a graph To gain some intuition about the divergence, consider the two-dimensional vector field $\mathbf{F} = \langle f, g \rangle = \langle x^2, y \rangle$ and a circle C of radius 2 centered at the origin (Figure 17.39).

- Without computing it, determine whether the two-dimensional divergence is positive or negative at the point $Q(1, 1)$. Why?
- Confirm your conjecture in part (a) by computing the two-dimensional divergence at Q .

Figure 17.39

► To understand the conclusion of Example 3a, note that as you move through the point Q from left to right, the horizontal components of the vectors increase in length ($f_x > 0$). As you move through the point Q in the upward direction, the vertical components of the vectors also increase in length ($g_y > 0$).

QUICK CHECK 2 Verify the claim made in Example 3d by showing that the net outward flux of $\mathbf{F}$ across C is positive. (Hint: If you use Green's Theorem to evaluate the integral $\int_C f \, dy - g \, dx$, convert to polar coordinates.) ◀

► Review: The *two-dimensional curl* $g_x - f_y$ measures the rotation of a vector field at a point. The circulation form of Green's Theorem implies that if the two-dimensional curl of a vector field is zero throughout a simply connected region, then the circulation on the boundary of the region is also zero. If the curl is nonzero, Green's Theorem gives the circulation along the curve.

- Based on part (b), over what regions within the circle is the divergence positive and over what regions within the circle is the divergence negative?
- By inspection of the figure, on what part of the circle is the flux across the boundary outward? Is the net flux out of the circle positive or negative?

SOLUTION

- At $Q(1, 1)$ the x -component and the y -component of the field are increasing ($f_x > 0$ and $g_y > 0$), so the field is expanding at that point and the two-dimensional divergence is positive.

- Calculating the two-dimensional divergence, we find that

$$\nabla \cdot \mathbf{F} = \frac{\partial}{\partial x}(x^2) + \frac{\partial}{\partial y}(y) = 2x + 1.$$

At $Q(1, 1)$ the divergence is 3, confirming part (a).

- From part (b), we see that $\nabla \cdot \mathbf{F} = 2x + 1 > 0$, for $x > -\frac{1}{2}$, and $\nabla \cdot \mathbf{F} < 0$, for $x < -\frac{1}{2}$. To the left of the line $x = -\frac{1}{2}$ the field is contracting, and to the right of the line the field is expanding.
- Using Figure 17.39, it appears that the field is tangent to the circle at two points with $x \approx -1$. For points on the circle with $x < -1$, the flow is into the circle; for points on the circle with $x > -1$, the flow is out of the circle. It appears that the net outward flux across C is positive. The points where the field changes from inward to outward may be determined exactly (Exercise 46).

Related Exercises 21–22 ◀

The Curl

Just as the divergence $\nabla \cdot \mathbf{F}$ is the dot product of the *del operator* and $\mathbf{F}$, the three-dimensional curl is the cross product $\nabla \times \mathbf{F}$. If we formally use the notation for the cross product in terms of a 3×3 determinant, we obtain the definition of the curl:

$$\begin{aligned} \nabla \times \mathbf{F} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ f & g & h \end{vmatrix} \begin{array}{l} \leftarrow \text{Unit Vectors} \\ \leftarrow \text{Components of } \nabla \\ \leftarrow \text{Components of } \mathbf{F} \end{array} \\ &= \left(\frac{\partial h}{\partial y} - \frac{\partial g}{\partial z} \right) \mathbf{i} + \left(\frac{\partial f}{\partial z} - \frac{\partial h}{\partial x} \right) \mathbf{j} + \left(\frac{\partial g}{\partial x} - \frac{\partial f}{\partial y} \right) \mathbf{k}. \end{aligned}$$

The curl of a vector field, also denoted $\text{curl } \mathbf{F}$, is a vector with three components. Notice that the $\mathbf{k}$ -component of the curl ($g_x - f_y$) is the two-dimensional curl, which gives the rotation in the xy -plane at a point. The $\mathbf{i}$ - and $\mathbf{j}$ -components of the curl correspond to the rotation of the vector field in planes parallel to the yz -plane (orthogonal to $\mathbf{i}$) and in planes parallel to the xz -plane (orthogonal to $\mathbf{j}$) (Figure 17.40).

Figure 17.40

DEFINITION Curl of a Vector Field

The **curl** of a vector field $\mathbf{F} = \langle f, g, h \rangle$ that is differentiable on a region of $\mathbb{R}^3$ is

$$\begin{aligned}\nabla \times \mathbf{F} &= \text{curl } \mathbf{F} \\ &= \left(\frac{\partial h}{\partial y} - \frac{\partial g}{\partial z} \right) \mathbf{i} + \left(\frac{\partial f}{\partial z} - \frac{\partial h}{\partial x} \right) \mathbf{j} + \left(\frac{\partial g}{\partial x} - \frac{\partial f}{\partial y} \right) \mathbf{k}.\end{aligned}$$

If $\nabla \times \mathbf{F} = \mathbf{0}$, the vector field is **irrotational**.

Curl of a General Rotation Vector Field We can clarify the physical meaning of the curl by considering the vector field $\mathbf{F} = \mathbf{a} \times \mathbf{r}$, where $\mathbf{a} = \langle a_1, a_2, a_3 \rangle$ is a nonzero constant vector and $\mathbf{r} = \langle x, y, z \rangle$. Writing out its components, we see that

$$\mathbf{F} = \mathbf{a} \times \mathbf{r} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ a_1 & a_2 & a_3 \\ x & y & z \end{vmatrix} = (a_2z - a_3y)\mathbf{i} + (a_3x - a_1z)\mathbf{j} + (a_1y - a_2x)\mathbf{k}.$$

This vector field is a *general rotation field* in three dimensions. With $a_1 = a_2 = 0$ and $a_3 = 1$, we have the familiar two-dimensional rotation field $\langle -y, x \rangle$ with its axis in the $\mathbf{k}$ -direction. More generally, $\mathbf{F}$ is the superposition of three rotation fields with axes in the $\mathbf{i}$ -, $\mathbf{j}$ -, and $\mathbf{k}$ -directions. The result is a single rotation field with an axis in the direction of $\mathbf{a}$ (Figure 17.41).

Three calculations tell us a lot about the general rotation field. The first calculation confirms that $\nabla \cdot \mathbf{F} = 0$ (Exercise 42). Just as with rotation fields in two dimensions, the divergence of a general rotation field is zero.

The second calculation (Exercises 43–44) uses the right-hand rule for cross products to show that the vector field $\mathbf{F} = \mathbf{a} \times \mathbf{r}$ is indeed a rotation field that circles the vector $\mathbf{a}$ in a counterclockwise direction looking along the length of $\mathbf{a}$ from head to tail (Figure 17.41).

The third calculation (Exercise 45) says that $\nabla \times \mathbf{F} = 2\mathbf{a}$. Therefore, the curl of the general rotation field is in the direction of the axis of rotation $\mathbf{a}$ (Figure 17.41). The magnitude of the curl is $|\nabla \times \mathbf{F}| = 2|\mathbf{a}|$. It can be shown (Exercise 52) that if $\mathbf{F}$ is a velocity field, then $|\mathbf{a}|$ is the constant angular speed of rotation of the field, denoted ω . The angular speed is the rate (radians per unit time) at which a small particle in the vector field rotates about the axis of the field. Therefore, the angular speed is half the magnitude of the curl, or

$$\omega = |\mathbf{a}| = \frac{1}{2} |\nabla \times \mathbf{F}|.$$

The rotation field $\mathbf{F} = \mathbf{a} \times \mathbf{r}$ suggests a related question. Suppose a paddle wheel is placed in the vector field $\mathbf{F}$ at a point P with the axis of the wheel in the direction of a unit vector $\mathbf{n}$ (Figure 17.42). How should $\mathbf{n}$ be chosen so the paddle wheel spins fastest? The scalar component of $\nabla \times \mathbf{F}$ in the direction of $\mathbf{n}$ is

$$(\nabla \times \mathbf{F}) \cdot \mathbf{n} = |\nabla \times \mathbf{F}| \cos \theta, \quad (|\mathbf{n}| = 1)$$

where θ is the angle between $\nabla \times \mathbf{F}$ and $\mathbf{n}$. The scalar component is greatest in magnitude and the paddle wheel spins fastest when $\theta = 0$ or $\theta = \pi$; that is, when $\mathbf{n}$ and $\nabla \times \mathbf{F}$ are parallel. If the axis of the paddle wheel is orthogonal to $\nabla \times \mathbf{F}$ ($\theta = \pm\pi/2$), the wheel doesn't spin.

General Rotation Vector Field

The **general rotation vector field** is $\mathbf{F} = \mathbf{a} \times \mathbf{r}$, where the nonzero constant vector $\mathbf{a} = \langle a_1, a_2, a_3 \rangle$ is the axis of rotation and $\mathbf{r} = \langle x, y, z \rangle$. For all nonzero choices of $\mathbf{a}$, $|\nabla \times \mathbf{F}| = 2|\mathbf{a}|$ and $\nabla \cdot \mathbf{F} = 0$. If $\mathbf{F}$ is a velocity field, then the constant angular speed of the field is

$$\omega = |\mathbf{a}| = \frac{1}{2} |\nabla \times \mathbf{F}|.$$

Figure 17.41

- Just as $\nabla f \cdot \mathbf{n}$ is the directional derivative in the direction $\mathbf{n}$, $(\nabla \times \mathbf{F}) \cdot \mathbf{n}$ is the directional spin in the direction $\mathbf{n}$.

Figure 17.42

QUICK CHECK 3 Show that if a vector field has the form $\mathbf{F} = \langle f(x), g(y), h(z) \rangle$, then $\nabla \times \mathbf{F} = \mathbf{0}$. ◀

EXAMPLE 4 Curl of a rotation field Compute the curl of the rotation field $\mathbf{F} = \mathbf{a} \times \mathbf{r}$, where $\mathbf{a} = \langle 2, -1, 1 \rangle$ and $\mathbf{r} = \langle x, y, z \rangle$ (Figure 17.41). What are the direction and the magnitude of the curl?

SOLUTION A quick calculation shows that

$$\mathbf{F} = \mathbf{a} \times \mathbf{r} = (-y - z)\mathbf{i} + (x - 2z)\mathbf{j} + (x + 2y)\mathbf{k}.$$

The curl of the vector field is

$$\nabla \times \mathbf{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ -y - z & x - 2z & x + 2y \end{vmatrix} = 4\mathbf{i} - 2\mathbf{j} + 2\mathbf{k} = 2\mathbf{a}.$$

We have confirmed that $\nabla \times \mathbf{F} = 2\mathbf{a}$ and that the direction of the curl is the direction of $\mathbf{a}$, which is the axis of rotation. The magnitude of $\nabla \times \mathbf{F}$ is $|2\mathbf{a}| = 2\sqrt{6}$, which is twice the angular speed of rotation.

Related Exercises 25–26 ◀

Working with Divergence and Curl

The divergence and curl satisfy some of the same properties that ordinary derivatives satisfy. For example, given a real number c and differentiable vector fields $\mathbf{F}$ and $\mathbf{G}$, we have the following properties.

Divergence Properties

$$\nabla \cdot (\mathbf{F} + \mathbf{G}) = \nabla \cdot \mathbf{F} + \nabla \cdot \mathbf{G}$$

$$\nabla \cdot (c\mathbf{F}) = c(\nabla \cdot \mathbf{F})$$

Curl Properties

$$\nabla \times (\mathbf{F} + \mathbf{G}) = (\nabla \times \mathbf{F}) + (\nabla \times \mathbf{G})$$

$$\nabla \times (c\mathbf{F}) = c(\nabla \times \mathbf{F})$$

These and other properties are explored in Exercises 65–72.

Additional properties that have importance in theory and applications are presented in the following theorems and examples.

THEOREM 17.11 Curl of a Conservative Vector Field

Suppose $\mathbf{F}$ is a conservative vector field on an open region D of $\mathbb{R}^3$. Let $\mathbf{F} = \nabla\varphi$, where φ is a potential function with continuous second partial derivatives on D . Then $\nabla \times \mathbf{F} = \nabla \times \nabla\varphi = \mathbf{0}$: The curl of the gradient is the zero vector and $\mathbf{F}$ is irrotational.

Proof: We must calculate $\nabla \times \nabla\varphi$:

$$\nabla \times \nabla\varphi = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ \varphi_x & \varphi_y & \varphi_z \end{vmatrix} = \underbrace{(\varphi_{zy} - \varphi_{yz})}_{0}\mathbf{i} + \underbrace{(\varphi_{xz} - \varphi_{zx})}_{0}\mathbf{j} + \underbrace{(\varphi_{yx} - \varphi_{xy})}_{0}\mathbf{k} = \mathbf{0}.$$

The mixed partial derivatives are equal by Clairaut's Theorem (Theorem 15.4).

The converse of this theorem (if $\nabla \times \mathbf{F} = \mathbf{0}$, then $\mathbf{F}$ is a conservative field) is handled in Section 17.7 by means of Stokes' Theorem. ▶

► First note that $\nabla \times \mathbf{F}$ is a vector, so it makes sense to take the divergence of the curl.

THEOREM 17.12 Divergence of the Curl

Suppose $\mathbf{F} = \langle f, g, h \rangle$, where f , g , and h have continuous second partial derivatives. Then $\nabla \cdot (\nabla \times \mathbf{F}) = 0$: The divergence of the curl is zero.

Proof: Again, a calculation is needed:

$$\begin{aligned}\nabla \cdot (\nabla \times \mathbf{F}) &= \frac{\partial}{\partial x} \left(\frac{\partial h}{\partial y} - \frac{\partial g}{\partial z} \right) + \frac{\partial}{\partial y} \left(\frac{\partial f}{\partial z} - \frac{\partial h}{\partial x} \right) + \frac{\partial}{\partial z} \left(\frac{\partial g}{\partial x} - \frac{\partial f}{\partial y} \right) \\ &= \underbrace{(h_{yx} - h_{xy})}_0 + \underbrace{(g_{xz} - g_{zx})}_0 + \underbrace{(f_{zy} - f_{yz})}_0 = 0.\end{aligned}$$

Clairaut's Theorem (Theorem 15.4) ensures that the mixed partial derivatives are equal. ◀

The gradient, the divergence, and the curl may be combined in many ways—some of which are undefined. For example, the gradient of the curl ($\nabla(\nabla \times \mathbf{F})$) and the curl of the divergence ($\nabla \times (\nabla \cdot \mathbf{F})$) are undefined. However, a combination that *is* defined and is important is the divergence of the gradient $\nabla \cdot \nabla u$, where u is a scalar-valued function. This combination is denoted $\nabla^2 u$ and is called the **Laplacian** of u ; it arises in many physical situations (Exercises 56–58, 62). Carrying out the calculation, we find that

$$\nabla \cdot \nabla u = \frac{\partial}{\partial x} \frac{\partial u}{\partial x} + \frac{\partial}{\partial y} \frac{\partial u}{\partial y} + \frac{\partial}{\partial z} \frac{\partial u}{\partial z} = \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2}.$$

We close with a result that is useful in its own right but is also intriguing because it parallels the Product Rule from single-variable calculus.

THEOREM 17.13 Product Rule for the Divergence

Let u be a scalar-valued function that is differentiable on a region D and let $\mathbf{F}$ be a vector field that is differentiable on D . Then

$$\nabla \cdot (u\mathbf{F}) = \nabla u \cdot \mathbf{F} + u(\nabla \cdot \mathbf{F}).$$

The rule says that the “derivative” of the product is the “derivative” of the first function multiplied by the second function plus the first function multiplied by the “derivative” of the second function. However, in each instance, “derivative” must be interpreted correctly for the operations to make sense. The proof of the theorem requires a direct calculation (Exercise 67). Other similar vector calculus identities are presented in Exercises 68–72.

QUICK CHECK 4 Is $\nabla \cdot (u\mathbf{F})$ a vector function or a scalar function? ◀

EXAMPLE 5 More properties of radial fields Let $\mathbf{r} = \langle x, y, z \rangle$ and let

$$\varphi = \frac{1}{|\mathbf{r}|} = (x^2 + y^2 + z^2)^{-1/2} \text{ be a potential function.}$$

a. Find the associated gradient field $\mathbf{F} = \nabla \left(\frac{1}{|\mathbf{r}|} \right)$.

b. Compute $\nabla \cdot \mathbf{F}$.

SOLUTION

a. The gradient has three components. Computing the first component reveals a pattern:

$$\frac{\partial \varphi}{\partial x} = \frac{\partial}{\partial x} (x^2 + y^2 + z^2)^{-1/2} = -\frac{1}{2} (x^2 + y^2 + z^2)^{-3/2} 2x = -\frac{x}{|\mathbf{r}|^3}.$$

Making a similar calculation for the y - and z -derivatives, the gradient is

$$\mathbf{F} = \nabla \left(\frac{1}{|\mathbf{r}|} \right) = -\frac{\langle x, y, z \rangle}{|\mathbf{r}|^3} = -\frac{\mathbf{r}}{|\mathbf{r}|^3}.$$

This result reveals that $\mathbf{F}$ is an inverse square vector field (for example, a gravitational or electric field), and its potential function is $\varphi = \frac{1}{|\mathbf{r}|}$.

- b. The divergence $\nabla \cdot \mathbf{F} = \nabla \cdot \left(-\frac{\mathbf{r}}{|\mathbf{r}|^3} \right)$ involves a product of the vector function $\mathbf{r} = \langle x, y, z \rangle$ and the scalar function $|\mathbf{r}|^{-3}$. Applying Theorem 17.13, we find that

$$\nabla \cdot \mathbf{F} = \nabla \cdot \left(-\frac{\mathbf{r}}{|\mathbf{r}|^3} \right) = -\nabla \frac{1}{|\mathbf{r}|^3} \cdot \mathbf{r} - \frac{1}{|\mathbf{r}|^3} \nabla \cdot \mathbf{r}.$$

A calculation similar to part (a) shows that $\nabla \frac{1}{|\mathbf{r}|^3} = -\frac{3\mathbf{r}}{|\mathbf{r}|^5}$ (Exercise 35). Therefore,

$$\begin{aligned} \nabla \cdot \mathbf{F} &= \nabla \cdot \left(-\frac{\mathbf{r}}{|\mathbf{r}|^3} \right) = -\nabla \frac{1}{|\mathbf{r}|^3} \cdot \mathbf{r} - \frac{1}{|\mathbf{r}|^3} \underbrace{\nabla \cdot \mathbf{r}}_3 \\ &= \frac{3\mathbf{r}}{|\mathbf{r}|^5} \cdot \mathbf{r} - \frac{3}{|\mathbf{r}|^3} && \text{Substitute for } \nabla \frac{1}{|\mathbf{r}|^3}. \\ &= \frac{3|\mathbf{r}|^2}{|\mathbf{r}|^5} - \frac{3}{|\mathbf{r}|^3} && \mathbf{r} \cdot \mathbf{r} = |\mathbf{r}|^2 \\ &= 0. \end{aligned}$$

The result is consistent with Theorem 17.10 (with $p = 3$): The divergence of an inverse square vector field in $\mathbb{R}^3$ is zero. It does not happen for any other radial fields of this form.

Related Exercises 35–36 ◀

Summary of Properties of Conservative Vector Fields

We can now extend the list of equivalent properties of conservative vector fields $\mathbf{F}$ defined on an open connected region. Theorem 17.11 is added to the list given at the end of Section 17.3.

Properties of a Conservative Vector Field

Let $\mathbf{F}$ be a conservative vector field whose components have continuous second partial derivatives on an open connected region D in $\mathbb{R}^3$. Then $\mathbf{F}$ has the following equivalent properties.

1. There exists a potential function φ such that $\mathbf{F} = \nabla \varphi$ (definition).
2. $\int_C \mathbf{F} \cdot d\mathbf{r} = \varphi(B) - \varphi(A)$ for all points A and B in D and all piecewise-smooth oriented curves C in D from A to B .
3. $\oint_C \mathbf{F} \cdot d\mathbf{r} = 0$ on all simple piecewise-smooth closed oriented curves C in D .
4. $\nabla \times \mathbf{F} = \mathbf{0}$ at all points of D .

Getting Started

1. Explain how to compute the divergence of the vector field $\mathbf{F} = \langle f, g, h \rangle$.
2. Interpret the divergence of a vector field.
3. What does it mean if the divergence of a vector field is zero throughout a region?
4. Explain how to compute the curl of the vector field $\mathbf{F} = \langle f, g, h \rangle$.
5. Interpret the curl of a general rotation vector field.

6. What does it mean if the curl of a vector field is zero throughout a region?
7. What is the value of $\nabla \cdot (\nabla \times \mathbf{F})$?
8. What is the value of $\nabla \times \nabla u$?

Practice Exercises

9–16. Divergence of vectors fields Find the divergence of the following vector fields.

9. $\mathbf{F} = \langle 2x, 4y, -3z \rangle$
10. $\mathbf{F} = \langle -2y, 3x, z \rangle$

11. $\mathbf{F} = \langle 12x, -6y, -6z \rangle$ 12. $\mathbf{F} = \langle x^2yz, -xy^2z, -xyz^2 \rangle$

13. $\mathbf{F} = \langle x^2 - y^2, y^2 - z^2, z^2 - x^2 \rangle$

14. $\mathbf{F} = \langle e^{-x+y}, e^{-y+z}, e^{-z+x} \rangle$

15. $\mathbf{F} = \frac{\langle x, y, z \rangle}{1 + x^2 + y^2}$

16. $\mathbf{F} = \langle yz \sin x, xz \cos y, xy \cos z \rangle$

17–20. Divergence of radial fields Calculate the divergence of the following radial fields. Express the result in terms of the position vector $\mathbf{r}$ and its length $|\mathbf{r}|$. Check for agreement with Theorem 17.10.

17. $\mathbf{F} = \frac{\langle x, y, z \rangle}{x^2 + y^2 + z^2} = \frac{\mathbf{r}}{|\mathbf{r}|^2}$

18. $\mathbf{F} = \frac{\langle x, y, z \rangle}{(x^2 + y^2 + z^2)^{3/2}} = \frac{\mathbf{r}}{|\mathbf{r}|^3}$

19. $\mathbf{F} = \frac{\langle x, y, z \rangle}{(x^2 + y^2 + z^2)^2} = \frac{\mathbf{r}}{|\mathbf{r}|^4}$

20. $\mathbf{F} = \langle x, y, z \rangle (x^2 + y^2 + z^2) = \mathbf{r}|\mathbf{r}|^2$

21–22. Divergence and flux from graphs Consider the following vector fields, the circle C , and two points P and Q .

- Without computing the divergence, does the graph suggest that the divergence is positive or negative at P and Q ? Justify your answer.
- Compute the divergence and confirm your conjecture in part (a).
- On what part of C is the flux outward? Inward?
- Is the net outward flux across C positive or negative?

21. $\mathbf{F} = \langle x, x + y \rangle$

22. $\mathbf{F} = \langle x, y^2 \rangle$

23–26. Curl of a rotation field Consider the following vector fields, where $\mathbf{r} = \langle x, y, z \rangle$.

- Compute the curl of the field and verify that it has the same direction as the axis of rotation.
- Compute the magnitude of the curl of the field.

23. $\mathbf{F} = \langle 1, 0, 0 \rangle \times \mathbf{r}$

24. $\mathbf{F} = \langle 1, -1, 0 \rangle \times \mathbf{r}$

25. $\mathbf{F} = \langle 1, -1, 1 \rangle \times \mathbf{r}$

26. $\mathbf{F} = \langle 1, -2, -3 \rangle \times \mathbf{r}$

27–34. Curl of a vector field Compute the curl of the following vector fields.

27. $\mathbf{F} = \langle x^2 - y^2, xy, z \rangle$

28. $\mathbf{F} = \langle 0, z^2 - y^2, -yz \rangle$

29. $\mathbf{F} = \langle x^2 - z^2, 1, 2xz \rangle$

30. $\mathbf{F} = \mathbf{r} = \langle x, y, z \rangle$

31. $\mathbf{F} = \frac{\langle x, y, z \rangle}{(x^2 + y^2 + z^2)^{3/2}} = \frac{\mathbf{r}}{|\mathbf{r}|^3}$

32. $\mathbf{F} = \frac{\langle x, y, z \rangle}{(x^2 + y^2 + z^2)^{1/2}} = \frac{\mathbf{r}}{|\mathbf{r}|}$

33. $\mathbf{F} = \langle z^2 \sin y, xz^2 \cos y, 2xz \sin y \rangle$

34. $\mathbf{F} = \langle 3xz^3e^{y^2}, 2xz^3e^{y^2}, 3xz^2e^{y^2} \rangle$

35–38. Derivative rules Prove the following identities. Use Theorem 17.13 (Product Rule) whenever possible.

35. $\nabla \left(\frac{1}{|\mathbf{r}|^3} \right) = -\frac{3\mathbf{r}}{|\mathbf{r}|^5}$ (used in Example 5)

36. $\nabla \left(\frac{1}{|\mathbf{r}|^2} \right) = -\frac{2\mathbf{r}}{|\mathbf{r}|^4}$

37. $\nabla \cdot \nabla \left(\frac{1}{|\mathbf{r}|^2} \right) = \frac{2}{|\mathbf{r}|^4}$ (Hint: Use Exercise 36.)

38. $\nabla(\ln |\mathbf{r}|) = \frac{\mathbf{r}}{|\mathbf{r}|^2}$

39. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- For a function f of a single variable, if $f'(x) = 0$ for all x in the domain, then f is a constant function. If $\nabla \cdot \mathbf{F} = 0$ for all points in the domain, then $\mathbf{F}$ is constant.
- If $\nabla \times \mathbf{F} = \mathbf{0}$, then $\mathbf{F}$ is constant.
- A vector field consisting of parallel vectors has zero curl.
- A vector field consisting of parallel vectors has zero divergence.
- $\text{curl } \mathbf{F}$ is orthogonal to $\mathbf{F}$.

40. Another derivative combination Let $\mathbf{F} = \langle f, g, h \rangle$ and let u be a differentiable scalar-valued function.

- Take the dot product of $\mathbf{F}$ and the del operator; then apply the result to u to show that

$$\begin{aligned} (\mathbf{F} \cdot \nabla)u &= \left(f \frac{\partial}{\partial x} + g \frac{\partial}{\partial y} + h \frac{\partial}{\partial z} \right) u \\ &= f \frac{\partial u}{\partial x} + g \frac{\partial u}{\partial y} + h \frac{\partial u}{\partial z}. \end{aligned}$$

- Evaluate $(\mathbf{F} \cdot \nabla)(xy^2z^3)$ at $(1, 1, 1)$, where $\mathbf{F} = \langle 1, 1, 1 \rangle$.

41. Does it make sense? Are the following expressions defined? If so, state whether the result is a scalar or a vector. Assume $\mathbf{F}$ is a sufficiently differentiable vector field and φ is a sufficiently differentiable scalar-valued function.

- | | | |
|-----------------------------------|--|---|
| a. $\nabla \cdot \varphi$ | b. $\nabla \mathbf{F}$ | c. $\nabla \cdot \nabla \varphi$ |
| d. $\nabla(\nabla \cdot \varphi)$ | e. $\nabla(\nabla \times \varphi)$ | f. $\nabla \cdot (\nabla \cdot \mathbf{F})$ |
| g. $\nabla \times \nabla \varphi$ | h. $\nabla \times (\nabla \cdot \mathbf{F})$ | i. $\nabla \times (\nabla \times \mathbf{F})$ |

42. Zero divergence of the rotation field Show that the general rotation field $\mathbf{F} = \mathbf{a} \times \mathbf{r}$, where $\mathbf{a}$ is a nonzero constant vector and $\mathbf{r} = \langle x, y, z \rangle$, has zero divergence.

43. General rotation fields

- Let $\mathbf{a} = \langle 0, 1, 0 \rangle$, let $\mathbf{r} = \langle x, y, z \rangle$, and consider the rotation field $\mathbf{F} = \mathbf{a} \times \mathbf{r}$. Use the right-hand rule for cross products to find the direction of $\mathbf{F}$ at the points $(0, 1, 1)$, $(1, 1, 0)$, $(0, 1, -1)$, and $(-1, 1, 0)$.
- With $\mathbf{a} = \langle 0, 1, 0 \rangle$, explain why the rotation field $\mathbf{F} = \mathbf{a} \times \mathbf{r}$ circles the y -axis in the counterclockwise direction looking along $\mathbf{a}$ from head to tail (that is, in the negative y -direction).

44. General rotation fields Generalize Exercise 43 to show that the rotation field $\mathbf{F} = \mathbf{a} \times \mathbf{r}$ circles the vector $\mathbf{a}$ in the counterclockwise direction looking along $\mathbf{a}$ from head to tail.

45. Curl of the rotation field For the general rotation field $\mathbf{F} = \mathbf{a} \times \mathbf{r}$, where $\mathbf{a}$ is a nonzero constant vector and $\mathbf{r} = \langle x, y, z \rangle$, show that $\text{curl } \mathbf{F} = 2\mathbf{a}$.

46. Inward to outward Find the exact points on the circle $x^2 + y^2 = 2$ at which the field $\mathbf{F} = \langle f, g \rangle = \langle x^2, y \rangle$ switches from pointing inward to pointing outward on the circle, or vice versa.

47. Maximum divergence Within the cube $\{(x, y, z) : |x| \leq 1, |y| \leq 1, |z| \leq 1\}$, where does $\text{div } \mathbf{F}$ have the greatest magnitude when $\mathbf{F} = \langle x^2 - y^2, xy^2z, 2xz \rangle$?

48. Maximum curl Let $\mathbf{F} = \langle z, 0, -y \rangle$.

- Find the scalar component of $\text{curl } \mathbf{F}$ in the direction of the unit vector $\mathbf{n} = \langle 1, 0, 0 \rangle$.
- Find the scalar component of $\text{curl } \mathbf{F}$ in the direction of the unit vector $\mathbf{n} = \left\langle \frac{1}{\sqrt{3}}, -\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}} \right\rangle$.
- Find the unit vector $\mathbf{n}$ that maximizes $\text{scal}_{\mathbf{n}} \langle -1, 1, 0 \rangle$ and state the value of $\text{scal}_{\mathbf{n}} \langle -1, 1, 0 \rangle$ in this direction.

49. Zero component of the curl For what vectors $\mathbf{n}$ is $(\text{curl } \mathbf{F}) \cdot \mathbf{n} = 0$ when $\mathbf{F} = \langle y, -2z, -x \rangle$?

50–51. Find a vector field Find a vector field $\mathbf{F}$ with the given curl. In each case, is the vector field you found unique?

50. $\text{curl } \mathbf{F} = \langle 0, 1, 0 \rangle$

51. $\text{curl } \mathbf{F} = \langle 0, z, -y \rangle$

Explorations and Challenges

52. Curl and angular speed Consider the rotational velocity field $\mathbf{v} = \mathbf{a} \times \mathbf{r}$, where $\mathbf{a}$ is a nonzero constant vector and $\mathbf{r} = \langle x, y, z \rangle$. Use the fact that an object moving in a circular path of radius R with speed $|\mathbf{v}|$ has an angular speed of $\omega = |\mathbf{v}|/R$.

- Sketch a position vector $\mathbf{a}$, which is the axis of rotation for the vector field, and a position vector $\mathbf{r}$ of a point P in $\mathbb{R}^3$. Let θ be the angle between the two vectors. Show that the perpendicular distance from P to the axis of rotation is $R = |\mathbf{r}| \sin \theta$.

b. Show that the speed of a particle in the velocity field is $|\mathbf{a} \times \mathbf{r}|$ and that the angular speed of the object is $|\mathbf{a}|$.

c. Conclude that $\omega = \frac{1}{2} |\nabla \times \mathbf{v}|$.

53. Paddle wheel in a vector field Let $\mathbf{F} = \langle z, 0, 0 \rangle$ and let $\mathbf{n}$ be a unit vector aligned with the axis of a paddle wheel located on the x -axis (see figure).

- If the paddle wheel is oriented with $\mathbf{n} = \langle 1, 0, 0 \rangle$, in what direction (if any) does the wheel spin?
- If the paddle wheel is oriented with $\mathbf{n} = \langle 0, 1, 0 \rangle$, in what direction (if any) does the wheel spin?
- If the paddle wheel is oriented with $\mathbf{n} = \langle 0, 0, 1 \rangle$, in what direction (if any) does the wheel spin?

54. Angular speed Consider the rotational velocity field $\mathbf{v} = \langle -2y, 2z, 0 \rangle$.

- If a paddle wheel is placed in the xy -plane with its axis normal to this plane, what is its angular speed?
- If a paddle wheel is placed in the xz -plane with its axis normal to this plane, what is its angular speed?
- If a paddle wheel is placed in the yz -plane with its axis normal to this plane, what is its angular speed?

55. Angular speed Consider the rotational velocity field $\mathbf{v} = \langle 0, 10z, -10y \rangle$. If a paddle wheel is placed in the plane $x + y + z = 1$ with its axis normal to this plane, how fast does the paddle wheel spin (in revolutions per unit time)?

56–58. Heat flux Suppose a solid object in $\mathbb{R}^3$ has a temperature distribution given by $T(x, y, z)$. The heat flow vector field in the object is $\mathbf{F} = -k\nabla T$, where the conductivity $k > 0$ is a property of the material. Note that the heat flow vector points in the direction opposite to that of the gradient, which is the direction of greatest temperature decrease. The divergence of the heat flow vector is $\nabla \cdot \mathbf{F} = -k\nabla \cdot \nabla T = -k\nabla^2 T$ (the Laplacian of T). Compute the heat flow vector field and its divergence for the following temperature distributions.

56. $T(x, y, z) = 100e^{-\sqrt{x^2+y^2+z^2}}$

57. $T(x, y, z) = 100e^{-x^2+y^2+z^2}$

58. $T(x, y, z) = 100(1 + \sqrt{x^2 + y^2 + z^2})$

59. Gravitational potential The potential function for the gravitational force field due to a mass M at the origin acting on a mass m is $\varphi = GmM/|\mathbf{r}|$, where $\mathbf{r} = \langle x, y, z \rangle$ is the position vector of the mass m , and G is the gravitational constant.

- Compute the gravitational force field $\mathbf{F} = -\nabla \varphi$.
- Show that the field is irrotational; that is, show that $\nabla \times \mathbf{F} = \mathbf{0}$.

- 60. Electric potential** The potential function for the force field due to a charge q at the origin is $\varphi = \frac{1}{4\pi\epsilon_0} \frac{q}{|\mathbf{r}|}$, where $\mathbf{r} = \langle x, y, z \rangle$ is

the position vector of a point in the field, and ϵ_0 is the permittivity of free space.

- Compute the force field $\mathbf{F} = -\nabla\varphi$.
- Show that the field is irrotational; that is, show that $\nabla \times \mathbf{F} = \mathbf{0}$.

- 61. Navier-Stokes equation** The Navier-Stokes equation is the fundamental equation of fluid dynamics that models the flow in everything from bathtubs to oceans. In one of its many forms (incompressible, viscous flow), the equation is

$$\rho \left(\frac{\partial \mathbf{V}}{\partial t} + (\mathbf{V} \cdot \nabla) \mathbf{V} \right) = -\nabla p + \mu (\nabla \cdot \nabla) \mathbf{V}.$$

In this notation, $\mathbf{V} = \langle u, v, w \rangle$ is the three-dimensional velocity field, p is the (scalar) pressure, ρ is the constant density of the fluid, and μ is the constant viscosity. Write out the three component equations of this vector equation. (See Exercise 40 for an interpretation of the operations.)

- 62. Stream function and vorticity** The rotation of a three-dimensional velocity field $\mathbf{V} = \langle u, v, w \rangle$ is measured by the **vorticity** $\boldsymbol{\omega} = \nabla \times \mathbf{V}$. If $\boldsymbol{\omega} = \mathbf{0}$ at all points in the domain, the flow is irrotational.

- Which of the following velocity fields is irrotational: $\mathbf{V} = \langle 2, -3y, 5z \rangle$ or $\mathbf{V} = \langle y, x - z, -y \rangle$?
- Recall that for a two-dimensional source-free flow $\mathbf{V} = \langle u, v, 0 \rangle$, a stream function $\psi(x, y)$ may be defined such that $u = \psi_y$ and $v = -\psi_x$. For such a two-dimensional flow, let $\zeta = \mathbf{k} \cdot \nabla \times \mathbf{V}$ be the $\mathbf{k}$ -component of the vorticity. Show that $\nabla^2 \psi = \nabla \cdot \nabla \psi = -\zeta$.
- Consider the stream function $\psi(x, y) = \sin x \sin y$ on the square region $R = \{(x, y) : 0 \leq x \leq \pi, 0 \leq y \leq \pi\}$. Find the velocity components u and v ; then sketch the velocity field.
- For the stream function in part (c), find the vorticity function ζ as defined in part (b). Plot several level curves of the vorticity function. Where on R is it a maximum? A minimum?

- 63. Ampère's Law** One of Maxwell's equations for electromagnetic waves is $\nabla \times \mathbf{B} = C \frac{\partial \mathbf{E}}{\partial t}$, where $\mathbf{E}$ is the electric field, $\mathbf{B}$ is the magnetic field, and C is a constant.

- Show that the fields

$$\mathbf{E}(z, t) = A \sin(kz - \omega t) \mathbf{i} \text{ and } \mathbf{B}(z, t) = A \sin(kz - \omega t) \mathbf{j}$$

satisfy the equation for constants A , k , and ω , provided $\omega = k/C$.

- Make a rough sketch showing the directions of $\mathbf{E}$ and $\mathbf{B}$.

- 64. Splitting a vector field** Express the vector field $\mathbf{F} = \langle xy, 0, 0 \rangle$ in the form $\mathbf{V} + \mathbf{W}$, where $\nabla \cdot \mathbf{V} = 0$ and $\nabla \times \mathbf{W} = \mathbf{0}$.

- 65. Properties of div and curl** Prove the following properties of the divergence and curl. Assume $\mathbf{F}$ and $\mathbf{G}$ are differentiable vector fields and c is a real number.

- $\nabla \cdot (\mathbf{F} + \mathbf{G}) = \nabla \cdot \mathbf{F} + \nabla \cdot \mathbf{G}$
- $\nabla \times (\mathbf{F} + \mathbf{G}) = (\nabla \times \mathbf{F}) + (\nabla \times \mathbf{G})$
- $\nabla \cdot (c\mathbf{F}) = c(\nabla \cdot \mathbf{F})$
- $\nabla \times (c\mathbf{F}) = c(\nabla \times \mathbf{F})$

- 66. Equal curls** If two functions of one variable, f and g , have the property that $f' = g'$, then f and g differ by a constant. Prove or disprove: If $\mathbf{F}$ and $\mathbf{G}$ are nonconstant vector fields in $\mathbb{R}^2$ with $\text{curl } \mathbf{F} = \text{curl } \mathbf{G}$ and $\text{div } \mathbf{F} = \text{div } \mathbf{G}$ at all points of $\mathbb{R}^2$, then $\mathbf{F}$ and $\mathbf{G}$ differ by a constant vector.

67–72. Identities Prove the following identities. Assume φ is a differentiable scalar-valued function and $\mathbf{F}$ and $\mathbf{G}$ are differentiable vector fields, all defined on a region of $\mathbb{R}^3$.

- $\nabla \cdot (\varphi \mathbf{F}) = \nabla \varphi \cdot \mathbf{F} + \varphi \nabla \cdot \mathbf{F}$ (Product Rule)
- $\nabla \times (\varphi \mathbf{F}) = (\nabla \varphi \times \mathbf{F}) + (\varphi \nabla \times \mathbf{F})$ (Product Rule)
- $\nabla \cdot (\mathbf{F} \times \mathbf{G}) = \mathbf{G} \cdot (\nabla \times \mathbf{F}) - \mathbf{F} \cdot (\nabla \times \mathbf{G})$
- $\nabla \times (\mathbf{F} \times \mathbf{G}) = (\mathbf{G} \cdot \nabla) \mathbf{F} - \mathbf{G}(\nabla \cdot \mathbf{F}) - (\mathbf{F} \cdot \nabla) \mathbf{G} + \mathbf{F}(\nabla \cdot \mathbf{G})$
- $\nabla(\mathbf{F} \cdot \mathbf{G}) = (\mathbf{G} \cdot \nabla) \mathbf{F} + (\mathbf{F} \cdot \nabla) \mathbf{G} + \mathbf{G} \times (\nabla \times \mathbf{F}) + \mathbf{F} \times (\nabla \times \mathbf{G})$
- $\nabla \times (\nabla \times \mathbf{F}) = \nabla(\nabla \cdot \mathbf{F}) - (\nabla \cdot \nabla) \mathbf{F}$
- Divergence of radial fields** Prove that for a real number p , with $\mathbf{r} = \langle x, y, z \rangle$, $\nabla \cdot \frac{\langle x, y, z \rangle}{|\mathbf{r}|^p} = \frac{3-p}{|\mathbf{r}|^p}$.
- Gradients and radial fields** Prove that for a real number p , with $\mathbf{r} = \langle x, y, z \rangle$, $\nabla \left(\frac{1}{|\mathbf{r}|^p} \right) = \frac{-p\mathbf{r}}{|\mathbf{r}|^{p+2}}$.
- Divergence of gradient fields** Prove that for a real number p , with $\mathbf{r} = \langle x, y, z \rangle$, $\nabla \cdot \nabla \left(\frac{1}{|\mathbf{r}|^p} \right) = \frac{p(p-1)}{|\mathbf{r}|^{p+2}}$.

QUICK CHECK ANSWERS

- The x -derivative of the divergence is applied to $f(y, z)$, which gives zero. Similarly, the y - and z -derivatives are zero.
- The net outward flux is 4π .
- In the curl, the first component of $\mathbf{F}$ is differentiated only with respect to y and z , so the contribution from the first component is zero. Similarly, the second and third components of $\mathbf{F}$ make no contribution to the curl.
- The divergence is a scalar-valued function. ◀

17.6 Surface Integrals

We have studied integrals on the real line, on regions in the plane, on solid regions in space, and along curves in space. One situation is still unexplored. Suppose a sphere has a known temperature distribution; perhaps it is cold near the poles and warm near the equator. How do you find the average temperature over the entire sphere? In analogy with other average value calculations, we should expect to “add up” the temperature values

Parallel Concepts	
Curves	Surfaces
Arc length	Surface area
Line integrals	Surface integrals
One-parameter description	Two-parameter description

over the sphere and divide by the surface area of the sphere. Because the temperature varies continuously over the sphere, adding up means integrating. How do you integrate a function over a surface? This question leads to *surface integrals*.

It helps to keep curves, arc length, and line integrals in mind as we discuss surfaces, surface area, and surface integrals. What we discover about surfaces parallels what we already know about curves—all “lifted” up one dimension.

Parameterized Surfaces

A curve in $\mathbb{R}^2$ is defined parametrically by $\mathbf{r}(t) = \langle x(t), y(t) \rangle$, for $a \leq t \leq b$; it requires one parameter and two dependent variables. Stepping up one dimension to define a surface in $\mathbb{R}^3$, we need *two* parameters and *three* dependent variables. Letting u and v be parameters, the general parametric description of a surface has the form

$$\mathbf{r}(u, v) = \langle x(u, v), y(u, v), z(u, v) \rangle.$$

We make the assumption that the parameters vary over a rectangle $R = \{(u, v): a \leq u \leq b, c \leq v \leq d\}$ (Figure 17.43). As the parameters (u, v) vary over R , the vector $\mathbf{r}(u, v) = \langle x(u, v), y(u, v), z(u, v) \rangle$ sweeps out a surface S in $\mathbb{R}^3$.

Figure 17.43

We work extensively with three surfaces that are easily described in parametric form. As with parameterized curves, a parametric description of a surface is not unique.

Cylinders In Cartesian coordinates, the set

$$\{(x, y, z): x = a \cos \theta, y = a \sin \theta, 0 \leq \theta \leq 2\pi, 0 \leq z \leq h\},$$

where $a > 0$, is a cylindrical surface of radius a and height h with its axis along the z -axis. Using the parameters $u = \theta$ and $v = z$, a parametric description of the cylinder is

$$\mathbf{r}(u, v) = \langle x(u, v), y(u, v), z(u, v) \rangle = \langle a \cos u, a \sin u, v \rangle,$$

where $0 \leq u \leq 2\pi$ and $0 \leq v \leq h$ (Figure 17.44).

QUICK CHECK 1 Describe the surface $\mathbf{r}(u, v) = \langle 2 \cos u, 2 \sin u, v \rangle$, for $0 \leq u \leq \pi$ and $0 \leq v \leq 1$. ◀

Figure 17.44

► Note that when $r = 0$, $z = 0$ and when $r = a$, $z = h$.

► Recall the relationships between polar and rectangular coordinates:

$$x = r \cos \theta, y = r \sin \theta, \text{ and } x^2 + y^2 = r^2.$$

Cones The surface of a cone of height h and radius a with its vertex at the origin is described in cylindrical coordinates by

$$\{(r, \theta, z): 0 \leq r \leq a, 0 \leq \theta \leq 2\pi, z = rh/a\}.$$

For a fixed value of z , we have $r = az/h$; therefore, on the surface of the cone,

$$x = r \cos \theta = \frac{az}{h} \cos \theta \quad \text{and} \quad y = r \sin \theta = \frac{az}{h} \sin \theta.$$

Using the parameters $u = \theta$ and $v = z$, the parametric description of the conical surface is

$$\mathbf{r}(u, v) = \langle x(u, v), y(u, v), z(u, v) \rangle = \left\langle \frac{av}{h} \cos u, \frac{av}{h} \sin u, v \right\rangle,$$

where $0 \leq u \leq 2\pi$ and $0 \leq v \leq h$ (Figure 17.45).

Figure 17.45

QUICK CHECK 2 Describe the surface $\mathbf{r}(u, v) = \langle v \cos u, v \sin u, v \rangle$, for $0 \leq u \leq \pi$ and $0 \leq v \leq 10$. ◀

► The complete cylinder, cone, and sphere are generated as the angle variable θ varies over the half-open interval $[0, 2\pi)$. As in previous chapters, we will use the closed interval $[0, 2\pi]$.

Spheres The parametric description of a sphere of radius a centered at the origin comes directly from spherical coordinates:

$$\{(\rho, \varphi, \theta): \rho = a, 0 \leq \varphi \leq \pi, 0 \leq \theta \leq 2\pi\}.$$

Recall the following relationships among spherical and rectangular coordinates (Section 16.5):

$$x = a \sin \varphi \cos \theta, \quad y = a \sin \varphi \sin \theta, \quad z = a \cos \varphi.$$

When we define the parameters $u = \varphi$ and $v = \theta$, a parametric description of the sphere is

$$\mathbf{r}(u, v) = \langle a \sin u \cos v, a \sin u \sin v, a \cos u \rangle,$$

where $0 \leq u \leq \pi$ and $0 \leq v \leq 2\pi$ (Figure 17.46).

Figure 17.46

QUICK CHECK 3 Describe the surface $\mathbf{r}(u, v) = \langle 4 \sin u \cos v, 4 \sin u \sin v, 4 \cos u \rangle$, for $0 \leq u \leq \pi/2$ and $0 \leq v \leq \pi$. ◀

EXAMPLE 1 Parametric surfaces Find parametric descriptions for the following surfaces.

- The plane $3x - 2y + z = 2$
- The paraboloid $z = x^2 + y^2$, for $0 \leq z \leq 9$

SOLUTION

- a. Defining the parameters $u = x$ and $v = y$, we find that

$$z = 2 - 3x + 2y = 2 - 3u + 2v.$$

Therefore, a parametric description of the plane is

$$\mathbf{r}(u, v) = \langle u, v, 2 - 3u + 2v \rangle,$$

for $-\infty < u < \infty$ and $-\infty < v < \infty$.

- b. Thinking in terms of polar coordinates, we let $u = \theta$ and $v = \sqrt{z}$, which means that $z = v^2$. The equation of the paraboloid is $x^2 + y^2 = z = v^2$, so v plays the role of the polar coordinate r . Therefore, $x = v \cos \theta = v \cos u$ and $y = v \sin \theta = v \sin u$. A parametric description for the paraboloid is

$$\mathbf{r}(u, v) = \langle v \cos u, v \sin u, v^2 \rangle,$$

where $0 \leq u \leq 2\pi$ and $0 \leq v \leq 3$.

Alternatively, we could choose $u = \theta$ and $v = z$. The resulting description is

$$\mathbf{r}(u, v) = \langle \sqrt{v} \cos u, \sqrt{v} \sin u, v \rangle,$$

where $0 \leq u \leq 2\pi$ and $0 \leq v \leq 9$.

Related Exercises 9, 12

Surface Integrals of Scalar-Valued Functions

We now develop the surface integral of a scalar-valued function f defined on a smooth parameterized surface S described by the equation

$$\mathbf{r}(u, v) = \langle x(u, v), y(u, v), z(u, v) \rangle,$$

where the parameters vary over a rectangle $R = \{(u, v) : a \leq u \leq b, c \leq v \leq d\}$. The functions x , y , and z are assumed to have continuous partial derivatives with respect to u and v . The rectangular region R in the uv -plane is partitioned into rectangles, with sides of length Δu and Δv , that are ordered in some convenient way, for $k = 1, \dots, n$. The k th rectangle R_k , which has area $\Delta A = \Delta u \Delta v$, corresponds to a curved patch S_k on the surface S (Figure 17.47), which has area ΔS_k . We let (u_k, v_k) be the lower-left corner point of R_k . The parameterization then assigns (u_k, v_k) to a point $P(x(u_k, v_k), y(u_k, v_k), z(u_k, v_k))$, or more simply, $P(x_k, y_k, z_k)$, on S_k . To construct the surface integral, we define a Riemann sum, which adds up function values multiplied by areas of the respective patches:

$$\sum_{k=1}^n f(x(u_k, v_k), y(u_k, v_k), z(u_k, v_k)) \Delta S_k.$$

► A more general approach allows (u_k, v_k) to be an arbitrary point in the k th rectangle. The outcome of the two approaches is the same.

Figure 17.47

Figure 17.48

- In general, the vectors $\mathbf{t}_u$ and $\mathbf{t}_v$ are different for each patch, so they should carry a subscript k . To keep the notation as simple as possible, we have suppressed the subscripts on these vectors with the understanding that they change with k . These tangent vectors are given by partial derivatives because in each case, either u or v is held constant, while the other variable changes.

The crucial step is computing ΔS_k , the area of the k th patch S_k .

Figure 17.48 shows the patch S_k and the point $P(x_k, y_k, z_k)$. Two special vectors are tangent to the surface at P ; these vectors lie in the plane tangent to S at P .

- $\mathbf{t}_u$ is a vector tangent to the surface corresponding to a change in u with v constant in the uv -plane.
- $\mathbf{t}_v$ is a vector tangent to the surface corresponding to a change in v with u constant in the uv -plane.

Because the surface S may be written $\mathbf{r}(u, v) = \langle x(u, v), y(u, v), z(u, v) \rangle$, a tangent vector corresponding to a change in u with v fixed is

$$\mathbf{t}_u = \frac{\partial \mathbf{r}}{\partial u} = \left\langle \frac{\partial x}{\partial u}, \frac{\partial y}{\partial u}, \frac{\partial z}{\partial u} \right\rangle.$$

Similarly, a tangent vector corresponding to a change in v with u fixed is

$$\mathbf{t}_v = \frac{\partial \mathbf{r}}{\partial v} = \left\langle \frac{\partial x}{\partial v}, \frac{\partial y}{\partial v}, \frac{\partial z}{\partial v} \right\rangle.$$

Now consider an increment Δu in u with v fixed; the corresponding change in $\mathbf{r}$, which is $\mathbf{r}(u + \Delta u, v) - \mathbf{r}(u, v)$, can be approximated using the definition of the partial derivative of $\mathbf{r}$ with respect to u . Specifically, when Δu is small, we have

$$\frac{\partial \mathbf{r}}{\partial u} \approx \frac{1}{\Delta u} (\mathbf{r}(u + \Delta u, v) - \mathbf{r}(u, v)).$$

Multiplying both sides of this equation by Δu and recalling that $\mathbf{t}_u = \frac{\partial \mathbf{r}}{\partial u}$, we see that the change in $\mathbf{r}$ corresponding to the increment Δu is approximated by the vector

$$\mathbf{t}_u \Delta u \approx \underbrace{\mathbf{r}(u + \Delta u, v) - \mathbf{r}(u, v)}_{\text{change in } \mathbf{r} \text{ corresponding to } \Delta u}.$$

Using a similar line of reasoning, the change in $\mathbf{r}$ corresponding to the increment Δv (with u fixed) is approximated by the vector

$$\mathbf{t}_v \Delta v \approx \underbrace{\mathbf{r}(u, v + \Delta v) - \mathbf{r}(u, v)}_{\text{change in } \mathbf{r} \text{ corresponding to } \Delta v}.$$

As nonzero scalar multiples of $\mathbf{t}_u$ and $\mathbf{t}_v$, the vectors $\mathbf{t}_u \Delta u$ and $\mathbf{t}_v \Delta v$ are also tangent to the surface. They determine a parallelogram that lies in the plane tangent to S at P (Figure 17.48); the area of this parallelogram approximates the area of the k th patch S_k , which is ΔS_k .

Appealing to the cross product (Section 13.4), the area of the parallelogram is

$$|\mathbf{t}_u \Delta u \times \mathbf{t}_v \Delta v| = |\mathbf{t}_u \times \mathbf{t}_v| \Delta u \Delta v \approx \Delta S_k.$$

Note that $\mathbf{t}_u \times \mathbf{t}_v$ is evaluated at (u_k, v_k) and is a vector normal to the surface at P , which we assume to be nonzero at all points of S .

We write the Riemann sum with the observation that the areas of the parallelograms approximate the areas of the patches S_k :

$$\begin{aligned} & \sum_{k=1}^n f(x(u_k, v_k), y(u_k, v_k), z(u_k, v_k)) \Delta S_k \\ & \approx \sum_{k=1}^n f(x(u_k, v_k), y(u_k, v_k), z(u_k, v_k)) \underbrace{|\mathbf{t}_u \times \mathbf{t}_v| \Delta u \Delta v}_{\approx \Delta S_k}. \end{aligned}$$

We now assume f is continuous on S . As Δu and Δv approach zero, the areas of the parallelograms approach the areas of the corresponding patches on S . We define the limit

- The role that the factor $|\mathbf{t}_u \times \mathbf{t}_v| dA$ plays in surface integrals is analogous to the role played by $|\mathbf{r}'(t)| dt$ in line integrals.

of this Riemann sum to be the surface integral of f over S , which we write $\iint_S f(x, y, z) dS$. The surface integral is evaluated as an ordinary double integral over the region R in the uv -plane:

$$\begin{aligned} \iint_S f(x, y, z) dS &= \lim_{\Delta u, \Delta v \rightarrow 0} \sum_{k=1}^n f(x(u_k, v_k), y(u_k, v_k), z(u_k, v_k)) |\mathbf{t}_u \times \mathbf{t}_v| \Delta u \Delta v \\ &= \iint_R f(x(u, v), y(u, v), z(u, v)) |\mathbf{t}_u \times \mathbf{t}_v| dA. \end{aligned}$$

If R is a rectangular region, as we have assumed, the double integral becomes an iterated integral with respect to u and v with constant limits. In the special case that $f(x, y, z) = 1$, the integral gives the surface area of S .

DEFINITION Surface Integral of Scalar-Valued Functions on Parameterized Surfaces

Let f be a continuous scalar-valued function on a smooth surface S given parametrically by $\mathbf{r}(u, v) = \langle x(u, v), y(u, v), z(u, v) \rangle$, where u and v vary over $R = \{(u, v): a \leq u \leq b, c \leq v \leq d\}$. Assume also that the tangent vectors

$$\mathbf{t}_u = \frac{\partial \mathbf{r}}{\partial u} = \left\langle \frac{\partial x}{\partial u}, \frac{\partial y}{\partial u}, \frac{\partial z}{\partial u} \right\rangle \text{ and } \mathbf{t}_v = \frac{\partial \mathbf{r}}{\partial v} = \left\langle \frac{\partial x}{\partial v}, \frac{\partial y}{\partial v}, \frac{\partial z}{\partial v} \right\rangle \text{ are continuous on } R \text{ and}$$

the normal vector $\mathbf{t}_u \times \mathbf{t}_v$ is nonzero on R . Then the **surface integral of f over S** is

$$\iint_S f(x, y, z) dS = \iint_R f(x(u, v), y(u, v), z(u, v)) |\mathbf{t}_u \times \mathbf{t}_v| dA.$$

If $f(x, y, z) = 1$, this integral equals the surface area of S .

- The condition that $\mathbf{t}_u \times \mathbf{t}_v$ be nonzero means $\mathbf{t}_u$ and $\mathbf{t}_v$ are nonzero and not parallel. If $\mathbf{t}_u \times \mathbf{t}_v \neq \mathbf{0}$ at all points, then the surface is *smooth*. The value of the integral is independent of the parameterization of S .

EXAMPLE 2 Surface area of a cylinder and sphere Find the surface area of the following surfaces.

- A cylinder with radius $a > 0$ and height h (excluding the circular ends)
- A sphere of radius a

SOLUTION The critical step is evaluating the normal vector $\mathbf{t}_u \times \mathbf{t}_v$. It needs to be done only once for any given surface.

- As shown before, a parametric description of the cylinder is

$$\mathbf{r}(u, v) = \langle x(u, v), y(u, v), z(u, v) \rangle = \langle a \cos u, a \sin u, v \rangle,$$

where $0 \leq u \leq 2\pi$ and $0 \leq v \leq h$. The required normal vector is

$$\begin{aligned} \mathbf{t}_u \times \mathbf{t}_v &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial x}{\partial u} & \frac{\partial y}{\partial u} & \frac{\partial z}{\partial u} \\ \frac{\partial x}{\partial v} & \frac{\partial y}{\partial v} & \frac{\partial z}{\partial v} \end{vmatrix} && \text{Definition of cross product} \\ &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -a \sin u & a \cos u & 0 \\ 0 & 0 & 1 \end{vmatrix} && \text{Evaluate derivatives.} \\ &= \langle a \cos u, a \sin u, 0 \rangle. && \text{Compute cross product.} \end{aligned}$$

Notice that this normal vector points outward from the cylinder, away from the z -axis (Figure 17.49). It follows that

$$|\mathbf{t}_u \times \mathbf{t}_v| = \sqrt{a^2 \cos^2 u + a^2 \sin^2 u} = a.$$

Cylinder: $\mathbf{r}(u, v) = \langle a \cos u, a \sin u, v \rangle$, $0 \leq u \leq 2\pi$ and $0 \leq v \leq h$

Figure 17.49

Setting $f(x, y, z) = 1$, the surface area of the cylinder is

$$\iint_S 1 \, dS = \iint_R \underbrace{|\mathbf{t}_u \times \mathbf{t}_v|}_a \, dA = \int_0^{2\pi} \int_0^h a \, dv \, du = 2\pi ah,$$

confirming the formula for the surface area of a cylinder (excluding the ends).

b. A parametric description of the sphere is

$$\mathbf{r}(u, v) = \langle a \sin u \cos v, a \sin u \sin v, a \cos u \rangle,$$

where $0 \leq u \leq \pi$ and $0 \leq v \leq 2\pi$. The required normal vector is

$$\begin{aligned} \mathbf{t}_u \times \mathbf{t}_v &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ a \cos u \cos v & a \cos u \sin v & -a \sin u \\ -a \sin u \sin v & a \sin u \cos v & 0 \end{vmatrix} \\ &= \langle a^2 \sin^2 u \cos v, a^2 \sin^2 u \sin v, a^2 \sin u \cos u \rangle. \end{aligned}$$

Computing $|\mathbf{t}_u \times \mathbf{t}_v|$ requires several steps (Exercise 70). However, the needed result is quite simple: $|\mathbf{t}_u \times \mathbf{t}_v| = a^2 \sin u$ and the normal vector $\mathbf{t}_u \times \mathbf{t}_v$ points outward from the surface of the sphere (Figure 17.50). With $f(x, y, z) = 1$, the surface area of the sphere is

$$\iint_S 1 \, dS = \iint_R \underbrace{|\mathbf{t}_u \times \mathbf{t}_v|}_{a^2 \sin u} \, dA = \int_0^{2\pi} \int_0^\pi a^2 \sin u \, du \, dv = 4\pi a^2,$$

confirming the formula for the surface area of a sphere.

Figure 17.50

Related Exercises 19, 22 ◀

EXAMPLE 3 Surface area of a partial cylinder Find the surface area of the cylinder $\{(r, \theta): r = 4, 0 \leq \theta \leq 2\pi\}$ between the planes $z = 0$ and $z = 16 - 2x$ (excluding the top and bottom surfaces).

SOLUTION Figure 17.51 shows the cylinder bounded by the two planes. With $u = \theta$ and $v = z$, a parametric description of the cylinder is

$$\mathbf{r}(u, v) = \langle x(u, v), y(u, v), z(u, v) \rangle = \langle 4 \cos u, 4 \sin u, v \rangle.$$

The challenge is finding the limits on v , which is the z -coordinate. The plane $z = 16 - 2x$ intersects the cylinder in an ellipse; along this ellipse, as u varies between 0 and 2π , the parameter v also changes. To find the relationship between u and v along this intersection curve, notice that at any point on the cylinder, we have $x = 4 \cos u$ (remember that $u = \theta$). Making this substitution in the equation of the plane, we have

$$z = 16 - 2x = 16 - 2(4 \cos u) = 16 - 8 \cos u.$$

► Recall that for the sphere, $u = \varphi$ and $v = \theta$, where φ and θ are spherical coordinates. The element of surface area in spherical coordinates is $dS = a^2 \sin \varphi \, d\varphi \, d\theta$.

Figure 17.51

Region of integration in the uv -plane is
 $R = \{(u, v): 0 \leq u \leq 2\pi, 0 \leq v \leq 16 - 8 \cos u\}$.

Figure 17.52

Substituting $v = z$, the relationship between u and v is $v = 16 - 8 \cos u$ (Figure 17.52). Therefore, the region of integration in the uv -plane is

$$R = \{(u, v): 0 \leq u \leq 2\pi, 0 \leq v \leq 16 - 8 \cos u\}.$$

Recall from Example 2a that for the cylinder, $|\mathbf{t}_u \times \mathbf{t}_v| = a = 4$. Setting $f(x, y, z) = 1$, the surface integral for the area is

$$\begin{aligned} \iint_S 1 \, dS &= \iint_R \underbrace{|\mathbf{t}_u \times \mathbf{t}_v|}_{4} \, dA \\ &= \int_0^{2\pi} \int_0^{16-8\cos u} 4 \, dv \, du \\ &= 4 \int_0^{2\pi} (16 - 8 \cos u) \, du && \text{Evaluate inner integral.} \\ &= 4(16u - 8 \sin u) \Big|_0^{2\pi} && \text{Evaluate outer integral.} \\ &= 128\pi. && \text{Simplify.} \end{aligned}$$

Related Exercise 24 ◀

EXAMPLE 4 Average temperature on a sphere The temperature on the surface of a sphere of radius a varies with latitude according to the function $T(\varphi, \theta) = 10 + 50 \sin \varphi$, for $0 \leq \varphi \leq \pi$ and $0 \leq \theta \leq 2\pi$ (φ and θ are spherical coordinates, so the temperature is 10° at the poles, increasing to 60° at the equator). Find the average temperature over the sphere.

SOLUTION We use the parametric description of a sphere. With $u = \varphi$ and $v = \theta$, the temperature function becomes $f(u, v) = 10 + 50 \sin u$. Integrating the temperature over the sphere using the fact that $|\mathbf{t}_u \times \mathbf{t}_v| = a^2 \sin u$ (Example 2b), we have

$$\begin{aligned} \iint_S (10 + 50 \sin u) \, dS &= \iint_R (10 + 50 \sin u) \underbrace{|\mathbf{t}_u \times \mathbf{t}_v|}_{a^2 \sin u} \, dA \\ &= \int_0^\pi \int_0^{2\pi} (10 + 50 \sin u) a^2 \sin u \, dv \, du \\ &= 2\pi a^2 \int_0^\pi (10 + 50 \sin u) \sin u \, du && \text{Evaluate inner integral.} \\ &= 10\pi a^2 (4 + 5\pi). && \text{Evaluate outer integral.} \end{aligned}$$

The average temperature is the integrated temperature $10\pi a^2 (4 + 5\pi)$ divided by the surface area of the sphere $4\pi a^2$, so the average temperature is $(20 + 25\pi)/2 \approx 49.3^\circ$.

Related Exercise 42 ◀

Surface Integrals on Explicitly Defined Surfaces Suppose a smooth surface S is defined not parametrically, but explicitly, in the form $z = g(x, y)$ over a region R in the xy -plane. Such a surface may be treated as a parameterized surface. We simply define the parameters to be $u = x$ and $v = y$. Making these substitutions into the expression for $\mathbf{t}_u$ and $\mathbf{t}_v$, a short calculation (Exercise 71) reveals that $\mathbf{t}_u = \mathbf{t}_x = \langle 1, 0, z_x \rangle$, $\mathbf{t}_v = \mathbf{t}_y = \langle 0, 1, z_y \rangle$, and the required normal vector is

$$\mathbf{t}_x \times \mathbf{t}_y = \langle -z_x, -z_y, 1 \rangle.$$

It follows that

$$|\mathbf{t}_x \times \mathbf{t}_y| = |\langle -z_x, -z_y, 1 \rangle| = \sqrt{z_x^2 + z_y^2 + 1}.$$

With these observations, the surface integral over S can be expressed as a double integral over a region R in the xy -plane.

► This is a familiar result: A normal to the surface $z = g(x, y)$ at a point is a constant multiple of the gradient of $z - g(x, y)$, which is $\langle -g_x, -g_y, 1 \rangle = \langle -z_x, -z_y, 1 \rangle$. The factor $\sqrt{z_x^2 + z_y^2 + 1}$ is analogous to the factor $\sqrt{f'(x)^2 + 1}$ that appears in arc length integrals.

- If the surface S in Theorem 17.14 is generated by revolving a curve in the xy -plane about the x -axis, the theorem gives the standard surface area formula for surfaces of revolution (Exercise 75).

Figure 17.53

QUICK CHECK 4 The plane $z = y$ forms a 45° angle with the xy -plane. Suppose the plane is the roof of a room and the xy -plane is the floor of the room. Then 1 ft^2 on the floor becomes how many square feet when projected on the roof? ◀

Figure 17.54

THEOREM 17.14 Evaluation of Surface Integrals of Scalar-Valued Functions on Explicitly Defined Surfaces

Let f be a continuous function on a smooth surface S given by $z = g(x, y)$, for (x, y) in a region R . The surface integral of f over S is

$$\iint_S f(x, y, z) \, dS = \iint_R f(x, y, g(x, y)) \sqrt{z_x^2 + z_y^2 + 1} \, dA.$$

If $f(x, y, z) = 1$, the surface integral equals the area of the surface.

EXAMPLE 5 Area of a roof over an ellipse Find the area of the surface S that lies in the plane $z = 12 - 4x - 3y$ directly above the region R bounded by the ellipse $x^2/4 + y^2 = 1$ (Figure 17.53).

SOLUTION Because we are computing the area of the surface, we take $f(x, y, z) = 1$. Note that $z_x = -4$ and $z_y = -3$, so the factor $\sqrt{z_x^2 + z_y^2 + 1}$ has the value $\sqrt{(-4)^2 + (-3)^2 + 1} = \sqrt{26}$ (a constant because the surface is a plane). The relevant surface integral is

$$\iint_S 1 \, dS = \iint_R \underbrace{\sqrt{z_x^2 + z_y^2 + 1}}_{\sqrt{26}} \, dA = \sqrt{26} \iint_R dA.$$

The double integral that remains is simply the area of the region R bounded by the ellipse. Because the ellipse has semiaxes of length $a = 2$ and $b = 1$, its area is $\pi ab = 2\pi$. Therefore, the area of S is $2\pi\sqrt{26}$.

This result has a useful interpretation. The plane surface S is not horizontal, so it has a greater area than the horizontal region R beneath it. The factor that converts the area of R to the area of S is $\sqrt{26}$. Notice that if the roof *were* horizontal, then the surface would be $z = c$, the area conversion factor would be 1, and the area of the roof would equal the area of the floor beneath it.

Related Exercises 29–30 ◀

EXAMPLE 6 Mass of a conical sheet A thin conical sheet is described by the surface $z = (x^2 + y^2)^{1/2}$, for $0 \leq z \leq 4$. The density of the sheet in g/cm^2 is $\rho = f(x, y, z) = (8 - z)$ (decreasing from 8 g/cm^2 at the vertex to 4 g/cm^2 at the top of the cone; Figure 17.54). What is the mass of the cone?

SOLUTION We find the mass by integrating the density function over the surface of the cone. The projection of the cone on the xy -plane is found by setting $z = 4$ (the top of the cone) in the equation of the cone. We find that $(x^2 + y^2)^{1/2} = 4$; therefore, the region of integration is the disk $R = \{(x, y): x^2 + y^2 \leq 16\}$. The next step is to compute z_x and z_y in order to evaluate $\sqrt{z_x^2 + z_y^2 + 1}$. Differentiating $z^2 = x^2 + y^2$ implicitly gives $2zz_x = 2x$, or $z_x = x/z$. Similarly, $z_y = y/z$. Using the fact that $z^2 = x^2 + y^2$, we have

$$\sqrt{z_x^2 + z_y^2 + 1} = \sqrt{(x/z)^2 + (y/z)^2 + 1} = \sqrt{\underbrace{\frac{x^2 + y^2}{z^2}}_1 + 1} = \sqrt{2}.$$

To integrate the density over the conical surface, we set $f(x, y, z) = 8 - z$. Replacing z in the integrand by $r = (x^2 + y^2)^{1/2}$ and using polar coordinates, the mass in grams is given by

$$\begin{aligned} \iint_S f(x, y, z) \, dS &= \iint_R f(x, y, z) \underbrace{\sqrt{z_x^2 + z_y^2 + 1}}_{\sqrt{2}} \, dA \\ &= \sqrt{2} \iint_R (8 - z) \, dA \end{aligned}$$

Substitute.

$$\begin{aligned}
&= \sqrt{2} \iint_R (8 - \sqrt{x^2 + y^2}) \, dA && z = \sqrt{x^2 + y^2} \\
&= \sqrt{2} \int_0^{2\pi} \int_0^4 (8 - r) r \, dr \, d\theta && \text{Polar coordinates} \\
&= \sqrt{2} \int_0^{2\pi} \left(4r^2 - \frac{r^3}{3} \right) \Big|_0^4 \, d\theta && \text{Evaluate inner integral.} \\
&= \frac{128\sqrt{2}}{3} \int_0^{2\pi} d\theta && \text{Simplify.} \\
&= \frac{256\pi\sqrt{2}}{3} \approx 379. && \text{Evaluate outer integral.}
\end{aligned}$$

As a check, note that the surface area of the cone is $\pi r \sqrt{r^2 + h^2} \approx 71 \text{ cm}^2$. If the entire cone had the maximum density $\rho = 8 \text{ g/cm}^3$, its mass would be approximately 568 g. If the entire cone had the minimum density $\rho = 4 \text{ g/cm}^3$, its mass would be approximately 284 g. The actual mass is between these extremes and closer to the low value because the cone is lighter at the top, where the surface area is greater.

QUICK CHECK 5 Explain why the explicit description for a cylinder $x^2 + y^2 = a^2$ cannot be used for a surface integral over a cylinder, and a parametric description must be used. ◀

Figure 17.55

Surface Integrals of Vector Fields

Before beginning a discussion of surface integrals of vector fields, we must address two technical issues about surfaces and normal vectors.

The surfaces we consider in this text are called **two-sided**, or **orientable**, surfaces. To be orientable, a surface must have the property that the normal vectors vary continuously over the surface. In other words, when you walk on any closed path on an orientable surface and return to your starting point, your head must point in the same direction it did when you started. A well-known example of a *nonorientable* surface is the Möbius strip (Figure 17.55). Suppose you start walking the length of the Möbius strip at a point P with your head pointing upward. When you return to P , your head points in the opposite direction, or downward. Therefore, the Möbius strip is not orientable.

At any point of a parameterized orientable surface, there are two unit normal vectors. Therefore, the second point concerns the orientation of the surface or, equivalently, the direction of the normal vector. Once the direction of the normal vector is determined, the surface becomes **oriented**.

Figure 17.56

We make the common assumption that—unless specified otherwise—a closed orientable surface that fully encloses a region (such as a sphere) is oriented so that the normal vectors point in the *outward direction*. For a surface that does not enclose a region in $\mathbb{R}^3$, the orientation must be specified in some way. For example, we might specify that the normal vectors for a particular surface point in the general direction of the positive z -axis; that is, in an upward direction (Figure 17.56).

Now recall that the parameterization of a surface defines a normal vector $\mathbf{t}_u \times \mathbf{t}_v$ at each point. In many cases, the normal vectors are consistent with the specified orientation, in which case no adjustments need to be made. If the direction of $\mathbf{t}_u \times \mathbf{t}_v$ is not consistent with the specified orientation, then the sign of $\mathbf{t}_u \times \mathbf{t}_v$ must be reversed before doing calculations. This process is demonstrated in the following examples.

Flux Integrals It turns out that the most common surface integral of a vector field is a *flux integral*. Consider a vector field $\mathbf{F} = \langle f, g, h \rangle$, continuous on a region in $\mathbb{R}^3$, that represents the flow of a fluid or the transport of a substance. Given a smooth oriented surface S , we aim to compute the net flux of the vector field across the surface. In a small region containing a point P , the flux across the surface is proportional to the component of $\mathbf{F}$ in the direction of the unit normal vector $\mathbf{n}$ at P . If θ is the angle between $\mathbf{F}$ and $\mathbf{n}$, then this component is $\mathbf{F} \cdot \mathbf{n} = |\mathbf{F}| |\mathbf{n}| \cos \theta = |\mathbf{F}| \cos \theta$ (because $|\mathbf{n}| = 1$; Figure 17.57a). We have the following special cases.

- If $\mathbf{F}$ and the unit normal vector are aligned at P ($\theta = 0$), then the component of $\mathbf{F}$ in the direction $\mathbf{n}$ is $\mathbf{F} \cdot \mathbf{n} = |\mathbf{F}|$; that is, all of $\mathbf{F}$ flows across the surface in the direction of $\mathbf{n}$ (Figure 17.57b).
- If $\mathbf{F}$ and the unit normal vector point in opposite directions at P ($\theta = \pi$), then the component of $\mathbf{F}$ in the direction $\mathbf{n}$ is $\mathbf{F} \cdot \mathbf{n} = -|\mathbf{F}|$; that is, all of $\mathbf{F}$ flows across the surface in the direction opposite that of $\mathbf{n}$ (Figure 17.57c).
- If $\mathbf{F}$ and the unit normal vector are orthogonal at P ($\theta = \pi/2$), then the component of $\mathbf{F}$ in the direction $\mathbf{n}$ is $\mathbf{F} \cdot \mathbf{n} = 0$; that is, none of $\mathbf{F}$ flows across the surface at that point (Figure 17.57d).

Figure 17.57

The flux integral, denoted $\iint_S \mathbf{F} \cdot \mathbf{n} \, dS$ or $\iint_S \mathbf{F} \cdot d\mathbf{S}$, simply adds up the components of $\mathbf{F}$ normal to the surface at all points of the surface. Notice that $\mathbf{F} \cdot \mathbf{n}$ is a scalar-valued function. Here is how the flux integral is computed.

Suppose the smooth oriented surface S is parameterized in the form

$$\mathbf{r}(u, v) = \langle x(u, v), y(u, v), z(u, v) \rangle,$$

where u and v vary over a region R in the uv -plane. The required vector normal to the surface at a point is $\mathbf{t}_u \times \mathbf{t}_v$, which we assume to be consistent with the orientation of S .

- If $\mathbf{t}_u \times \mathbf{t}_v$ is not consistent with the specified orientation, its sign must be reversed.

Therefore, the *unit* normal vector consistent with the orientation is $\mathbf{n} = \frac{\mathbf{t}_u \times \mathbf{t}_v}{|\mathbf{t}_u \times \mathbf{t}_v|}$.

Appealing to the definition of the surface integral for parameterized surfaces, the flux integral is

$$\begin{aligned} \iint_S \mathbf{F} \cdot \mathbf{n} \, dS &= \iint_R \mathbf{F} \cdot \mathbf{n} |\mathbf{t}_u \times \mathbf{t}_v| \, dA && \text{Definition of surface integral} \\ &= \iint_R \mathbf{F} \cdot \underbrace{\frac{\mathbf{t}_u \times \mathbf{t}_v}{|\mathbf{t}_u \times \mathbf{t}_v|}}_{\mathbf{n}} |\mathbf{t}_u \times \mathbf{t}_v| \, dA && \text{Substitute for } \mathbf{n}. \\ &= \iint_R \mathbf{F} \cdot (\mathbf{t}_u \times \mathbf{t}_v) \, dA. && \text{Convenient cancellation} \end{aligned}$$

The remarkable occurrence in the flux integral is the cancellation of the factor $|\mathbf{t}_u \times \mathbf{t}_v|$.

The special case in which the surface S is specified in the form $z = s(x, y)$ follows directly by recalling that the required normal vector is $\mathbf{t}_u \times \mathbf{t}_v = \langle -z_x, -z_y, 1 \rangle$. In this case, with $\mathbf{F} = \langle f, g, h \rangle$, the integrand of the surface integral is $\mathbf{F} \cdot (\mathbf{t}_u \times \mathbf{t}_v) = -fz_x - gz_y + h$.

- The value of the surface integral is independent of the parameterization. However, in contrast to a surface integral of a scalar-valued function, the value of a surface integral of a vector field depends on the orientation of the surface. Changing the orientation changes the sign of the result.

DEFINITION Surface Integral of a Vector Field

Suppose $\mathbf{F} = \langle f, g, h \rangle$ is a continuous vector field on a region of $\mathbb{R}^3$ containing a smooth oriented surface S . If S is defined parametrically as $\mathbf{r}(u, v) = \langle x(u, v), y(u, v), z(u, v) \rangle$, for (u, v) in a region R , then

$$\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = \iint_R \mathbf{F} \cdot (\mathbf{t}_u \times \mathbf{t}_v) \, dA,$$

where $\mathbf{t}_u = \frac{\partial \mathbf{r}}{\partial u} = \left\langle \frac{\partial x}{\partial u}, \frac{\partial y}{\partial u}, \frac{\partial z}{\partial u} \right\rangle$ and $\mathbf{t}_v = \frac{\partial \mathbf{r}}{\partial v} = \left\langle \frac{\partial x}{\partial v}, \frac{\partial y}{\partial v}, \frac{\partial z}{\partial v} \right\rangle$ are continuous on R ,

the normal vector $\mathbf{t}_u \times \mathbf{t}_v$ is nonzero on R , and the direction of the normal vector is consistent with the orientation of S . If S is defined in the form $z = s(x, y)$, for (x, y) in a region R , then

$$\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = \iint_R (-fz_x - gz_y + h) \, dA.$$

Figure 17.58

EXAMPLE 7 Rain on a roof Consider the vertical vector field $\mathbf{F} = \langle 0, 0, -1 \rangle$, corresponding to a constant downward flow. Find the flux in the downward direction across the surface S , which is the plane $z = 4 - 2x - y$ in the first octant.

SOLUTION In this case, the surface is given explicitly. With $z = 4 - 2x - y$, we have $z_x = -2$ and $z_y = -1$. Therefore, the required normal vector is $\langle -z_x, -z_y, 1 \rangle = \langle 2, 1, 1 \rangle$, which points *upward* (the z -component of the vector is positive). Because we are interested in the *downward* flux of $\mathbf{F}$ across S , the surface must be oriented such that the normal vectors point downward. So we take the normal vector to be $\langle -2, -1, -1 \rangle$ (Figure 17.58). Letting R be the region in the xy -plane beneath S and noting that $\mathbf{F} = \langle f, g, h \rangle = \langle 0, 0, -1 \rangle$, the flux integral is

$$\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = \iint_R \langle 0, 0, -1 \rangle \cdot \langle -2, -1, -1 \rangle \, dA = \iint_R dA = \text{area of } R.$$

The base R is a triangle in the xy -plane with vertices $(0, 0)$, $(2, 0)$, and $(0, 4)$, so its area is 4. Therefore, the *downward* flux across S is 4. This flux integral has an interesting interpretation. If the vector field $\mathbf{F}$ represents the rate of rainfall with units of, say, g/m^2

per unit time, then the flux integral gives the mass of rain (in grams) that falls on the surface in a unit of time. This result says that (because the vector field is vertical) the mass of rain that falls on the roof equals the mass that would fall on the floor beneath the roof if the roof were not there. This property is explored further in Exercise 73.

Related Exercises 43–44 ◀

EXAMPLE 8 Flux of the radial field Consider the radial vector field $\mathbf{F} = \langle f, g, h \rangle = \langle x, y, z \rangle$. Is the upward flux of the field greater across the hemisphere $x^2 + y^2 + z^2 = 1$, for $z \geq 0$, or across the paraboloid $z = 1 - x^2 - y^2$, for $z \geq 0$? Note that the two surfaces have the same base in the xy -plane and the same high point $(0, 0, 1)$. Use the explicit description for the hemisphere and a parametric description for the paraboloid.

SOLUTION The base of both surfaces in the xy -plane is the unit disk $R = \{(x, y): x^2 + y^2 \leq 1\}$, which, when expressed in polar coordinates, is the set $\{(r, \theta): 0 \leq r \leq 1, 0 \leq \theta \leq 2\pi\}$. To use the explicit description for the hemisphere, we must compute z_x and z_y . Differentiating $x^2 + y^2 + z^2 = 1$ implicitly, we find that $z_x = -x/z$ and $z_y = -y/z$. Therefore, the required normal vector is $\langle x/z, y/z, 1 \rangle$, which points upward on the surface. The flux integral is evaluated by substituting for f, g, h, z_x , and z_y ; eliminating z from the integrand; and converting the integral in x and y to an integral in polar coordinates:

► Recall that the required normal vector for an explicitly defined surface $z = s(x, y)$ is $\langle -z_x, -z_y, 1 \rangle$.

$$\begin{aligned}
 \iint_S \mathbf{F} \cdot \mathbf{n} \, dS &= \iint_R (-fz_x - gz_y + h) \, dA \\
 &= \iint_R \left(x \frac{x}{z} + y \frac{y}{z} + z \right) dA && \text{Substitute.} \\
 &= \iint_R \left(\frac{x^2 + y^2 + z^2}{z} \right) dA && \text{Simplify.} \\
 &= \iint_R \left(\frac{1}{z} \right) dA && x^2 + y^2 + z^2 = 1 \\
 &= \iint_R \left(\frac{1}{\sqrt{1 - x^2 - y^2}} \right) dA && z = \sqrt{1 - x^2 - y^2} \\
 &= \int_0^{2\pi} \int_0^1 \left(\frac{1}{\sqrt{1 - r^2}} \right) r \, dr \, d\theta && \text{Polar coordinates} \\
 &= \int_0^{2\pi} \left(-\sqrt{1 - r^2} \right) \Big|_0^1 d\theta && \text{Evaluate inner integral as an improper integral.} \\
 &= \int_0^{2\pi} d\theta = 2\pi. && \text{Evaluate outer integral.}
 \end{aligned}$$

For the paraboloid $z = 1 - x^2 - y^2$, we use the parametric description (Example 1b or Table 17.3)

$$\mathbf{r}(u, v) = \langle x, y, z \rangle = \langle v \cos u, v \sin u, 1 - v^2 \rangle,$$

for $0 \leq u \leq 2\pi$ and $0 \leq v \leq 1$. The required vector normal to the surface is

$$\begin{aligned}
 \mathbf{t}_u \times \mathbf{t}_v &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -v \sin u & v \cos u & 0 \\ \cos u & \sin u & -2v \end{vmatrix} \\
 &= \langle -2v^2 \cos u, -2v^2 \sin u, -v \rangle.
 \end{aligned}$$

Notice that the normal vectors point downward on the surface (because the z -component is negative for $0 < v \leq 1$). In order to find the upward flux, we negate the normal vector and use the upward normal vector

$$-(\mathbf{t}_u \times \mathbf{t}_v) = \langle 2v^2 \cos u, 2v^2 \sin u, v \rangle.$$

The flux integral is evaluated by substituting for $\mathbf{F} = \langle x, y, z \rangle$ and $-(\mathbf{t}_u \times \mathbf{t}_v)$ and then evaluating an iterated integral in u and v :

$$\begin{aligned}\iint_S \mathbf{F} \cdot \mathbf{n} \, dS &= \int_0^1 \int_0^{2\pi} \langle v \cos u, v \sin u, 1 - v^2 \rangle \cdot \langle 2v^2 \cos u, 2v^2 \sin u, v \rangle \, du \, dv \\ &\quad \text{Substitute for } \mathbf{F} \text{ and } -(\mathbf{t}_u \times \mathbf{t}_v). \\ &= \int_0^1 \int_0^{2\pi} (v^3 + v) \, du \, dv \quad \text{Simplify.} \\ &= 2\pi \left(\frac{v^4}{4} + \frac{v^2}{2} \right) \Big|_0^1 = \frac{3\pi}{2}. \quad \text{Evaluate integrals.}\end{aligned}$$

QUICK CHECK 6 Explain why the upward flux for the radial field in Example 8 is greater for the hemisphere than for the paraboloid. ◀

We see that the upward flux is greater for the hemisphere than for the paraboloid.

Related Exercises 45, 47 ◀

SECTION 17.6 EXERCISES

Getting Started

1. Give a parametric description for a cylinder with radius a and height h , including the intervals for the parameters.
2. Give a parametric description for a cone with radius a and height h , including the intervals for the parameters.
3. Give a parametric description for a sphere with radius a , including the intervals for the parameters.
4. Explain how to compute the surface integral of a scalar-valued function f over a cone using an explicit description of the cone.
5. Explain how to compute the surface integral of a scalar-valued function f over a sphere using a parametric description of the sphere.
6. Explain what it means for a surface to be orientable.
7. Describe the usual orientation of a closed surface such as a sphere.
8. Why is the upward flux of a vertical vector field $\mathbf{F} = \langle 0, 0, 1 \rangle$ across a surface equal to the area of the projection of the surface in the xy -plane?

Practice Exercises

9–14. Parametric descriptions Give a parametric description of the form $\mathbf{r}(u, v) = \langle x(u, v), y(u, v), z(u, v) \rangle$ for the following surfaces. The descriptions are not unique. Specify the required rectangle in the uv -plane.

9. The plane $2x - 4y + 3z = 16$
10. The cap of the sphere $x^2 + y^2 + z^2 = 16$, for $2\sqrt{2} \leq z \leq 4$
11. The frustum of the cone $z^2 = x^2 + y^2$, for $2 \leq z \leq 8$
12. The cone $z^2 = 4(x^2 + y^2)$, for $0 \leq z \leq 4$
13. The portion of the cylinder $x^2 + y^2 = 9$ in the first octant, for $0 \leq z \leq 3$
14. The cylinder $y^2 + z^2 = 36$, for $0 \leq x \leq 9$

15–18. Identify the surface Describe the surface with the given parametric representation.

15. $\mathbf{r}(u, v) = \langle u, v, 2u + 3v - 1 \rangle$, for $1 \leq u \leq 3, 2 \leq v \leq 4$
16. $\mathbf{r}(u, v) = \langle u, u + v, 2 - u - v \rangle$, for $0 \leq u \leq 2, 0 \leq v \leq 2$

17. $\mathbf{r}(u, v) = \langle v \cos u, v \sin u, 4v \rangle$, for $0 \leq u \leq \pi, 0 \leq v \leq 3$

18. $\mathbf{r}(u, v) = \langle v, 6 \cos u, 6 \sin u \rangle$, for $0 \leq u \leq 2\pi, 0 \leq v \leq 2$

19–24. Surface area using a parametric description Find the area of the following surfaces using a parametric description of the surface.

19. The half-cylinder $\{(r, \theta, z): r = 4, 0 \leq \theta \leq \pi, 0 \leq z \leq 7\}$
20. The plane $z = 3 - x - 3y$ in the first octant
21. The plane $z = 10 - x - y$ above the square $|x| \leq 2, |y| \leq 2$
22. The hemisphere $x^2 + y^2 + z^2 = 100$, for $z \geq 0$
23. A cone with base radius r and height h , where r and h are positive constants
24. The cap of the sphere $x^2 + y^2 + z^2 = 4$, for $1 \leq z \leq 2$

25–28. Surface integrals using a parametric description Evaluate the surface integral $\iint_S f \, dS$ using a parametric description of the surface.

25. $f(x, y, z) = x^2 + y^2$, where S is the hemisphere $x^2 + y^2 + z^2 = 36$, for $z \geq 0$
26. $f(x, y, z) = y$, where S is the cylinder $x^2 + y^2 = 9$, $0 \leq z \leq 3$
27. $f(x, y, z) = x$, where S is the cylinder $x^2 + z^2 = 1$, $0 \leq y \leq 3$
28. $f(\rho, \varphi, \theta) = \cos \varphi$, where S is the part of the unit sphere in the first octant

29–34. Surface area using an explicit description Find the area of the following surfaces using an explicit description of the surface.

29. The part of the plane $z = 2x + 2y + 4$ over the region R bounded by the triangle with vertices $(0, 0)$, $(2, 0)$, and $(2, 4)$
30. The part of the plane $z = x + 3y + 5$ over the region $R = \{(x, y): 1 \leq x^2 + y^2 \leq 4\}$
31. The cone $z^2 = 4(x^2 + y^2)$, for $0 \leq z \leq 4$
32. The trough $z = \frac{1}{2}x^2$, for $-1 \leq x \leq 1, 0 \leq y \leq 4$
33. The paraboloid $z = 2(x^2 + y^2)$, for $0 \leq z \leq 8$
34. The part of the hyperbolic paraboloid $z = 3 + x^2 - y^2$ above the sector $R = \{(r, \theta): 0 \leq r \leq \sqrt{2}, 0 \leq \theta \leq \pi/2\}$

35–38. Surface integrals using an explicit description Evaluate the surface integral $\iint_S f(x, y, z) \, dS$ using an explicit representation of the surface.

35. $f(x, y, z) = xy$; S is the plane $z = 2 - x - y$ in the first octant.

36. $f(x, y, z) = x^2 + y^2$; S is the paraboloid $z = x^2 + y^2$, for $0 \leq z \leq 1$.

37. $f(x, y, z) = 25 - x^2 - y^2$; S is the hemisphere centered at the origin with radius 5, for $z \geq 0$.

38. $f(x, y, z) = e^z$; S is the plane $z = 8 - x - 2y$ in the first octant.

39–42. Average values

39. Find the average temperature on that part of the plane $2x + 2y + z = 4$ over the square $0 \leq x \leq 1, 0 \leq y \leq 1$, where the temperature is given by $T(x, y, z) = e^{2x+y+z-3}$.

T 40. Find the average squared distance between the origin and the points on the paraboloid $z = 4 - x^2 - y^2$, for $z \geq 0$.

41. Find the average value of the function $f(x, y, z) = xyz$ on the unit sphere in the first octant.

42. Find the average value of the temperature function $T(x, y, z) = 100 - 25z$ on the cone $z^2 = x^2 + y^2$, for $0 \leq z \leq 2$.

43–48. Surface integrals of vector fields Find the flux of the following vector fields across the given surface with the specified orientation. You may use either an explicit or a parametric description of the surface.

43. $\mathbf{F} = \langle 0, 0, -1 \rangle$ across the slanted face of the tetrahedron $z = 4 - x - y$ in the first octant; normal vectors point upward.

44. $\mathbf{F} = \langle x, y, z \rangle$ across the slanted face of the tetrahedron $z = 10 - 2x - 5y$ in the first octant; normal vectors point upward.

45. $\mathbf{F} = \langle x, y, z \rangle$ across the slanted surface of the cone $z^2 = x^2 + y^2$, for $0 \leq z \leq 1$; normal vectors point upward.

46. $\mathbf{F} = \langle e^{-y}, 2z, xy \rangle$ across the curved sides of the surface $S = \{(x, y, z): z = \cos y, |y| \leq \pi, 0 \leq x \leq 4\}$; normal vectors point upward.

47. $\mathbf{F} = \mathbf{r}/|\mathbf{r}|^3$ across the sphere of radius a centered at the origin, where $\mathbf{r} = \langle x, y, z \rangle$; normal vectors point outward.

48. $\mathbf{F} = \langle -y, x, 1 \rangle$ across the cylinder $y = x^2$, for $0 \leq x \leq 1, 0 \leq z \leq 4$; normal vectors point in the general direction of the positive y -axis.

49. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

a. If the surface S is given by $\{(x, y, z): 0 \leq x \leq 1, 0 \leq y \leq 1, z = 10\}$, then $\iint_S f(x, y, z) \, dS = \int_0^1 \int_0^1 f(x, y, 10) \, dx \, dy$.

b. If the surface S is given by $\{(x, y, z): 0 \leq x \leq 1, 0 \leq y \leq 1, z = x\}$, then $\iint_S f(x, y, z) \, dS = \int_0^1 \int_0^1 f(x, y, x) \, dx \, dy$.

c. The surface $\mathbf{r} = \langle v \cos u, v \sin u, v^2 \rangle$, for $0 \leq u \leq \pi, 0 \leq v \leq 2$, is the same as the surface $\mathbf{r} = \langle \sqrt{v} \cos 2u, \sqrt{v} \sin 2u, v \rangle$, for $0 \leq u \leq \pi/2, 0 \leq v \leq 4$.

d. Given the standard parameterization of a sphere, the normal vectors $\mathbf{t}_u \times \mathbf{t}_v$ are outward normal vectors.

50–53. Miscellaneous surface integrals Evaluate the following integrals using the method of your choice. Assume normal vectors point either outward or upward.

50. $\iint_S \nabla \ln |\mathbf{r}| \cdot \mathbf{n} \, dS$, where S is the hemisphere $x^2 + y^2 + z^2 = a^2$, for $z \geq 0$, and where $\mathbf{r} = \langle x, y, z \rangle$

51. $\iint_S |\mathbf{r}| \, dS$, where S is the cylinder $x^2 + y^2 = 4$, for $0 \leq z \leq 8$, where $\mathbf{r} = \langle x, y, z \rangle$

52. $\iint_S xyz \, dS$, where S is that part of the plane $z = 6 - y$ that lies in the cylinder $x^2 + y^2 = 4$

53. $\iint_S \frac{\langle x, 0, z \rangle}{\sqrt{x^2 + z^2}} \cdot \mathbf{n} \, dS$, where S is the cylinder $x^2 + z^2 = a^2$, $|y| \leq 2$

54. Cone and sphere The cone $z^2 = x^2 + y^2$, for $z \geq 0$, cuts the sphere $x^2 + y^2 + z^2 = 16$ along a curve C .

- Find the surface area of the sphere below C , for $z \geq 0$.
- Find the surface area of the sphere above C .
- Find the surface area of the cone below C , for $z \geq 0$.

T 55. **Cylinder and sphere** Consider the sphere $x^2 + y^2 + z^2 = 4$ and the cylinder $(x - 1)^2 + y^2 = 1$, for $z \geq 0$. Find the surface area of the cylinder inside the sphere.

56. Flux on a tetrahedron Find the upward flux of the field

$\mathbf{F} = \langle x, y, z \rangle$ across the plane $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$ in the first octant, where a, b , and c are positive real numbers. Show that the flux equals c times the area of the base of the region. Interpret the result physically.

57. Flux across a cone Consider the field $\mathbf{F} = \langle x, y, z \rangle$ and the cone $z^2 = \frac{x^2 + y^2}{a^2}$, for $0 \leq z \leq 1$.

- Show that when $a = 1$, the outward flux across the cone is zero. Interpret the result.
- Find the outward flux (away from the z -axis), for any $a > 0$. Interpret the result.

58. Surface area formula for cones Find the general formula for the surface area of a cone with height h and base radius a (excluding the base).

59. Surface area formula for spherical cap A sphere of radius a is sliced parallel to the equatorial plane at a distance $a - h$ from the equatorial plane (see figure). Find the general formula for the surface area of the resulting spherical cap (excluding the base) with thickness h .

Explorations and Challenges

60. Radial fields and spheres Consider the radial field $\mathbf{F} = \mathbf{r}/|\mathbf{r}|^p$, where $\mathbf{r} = \langle x, y, z \rangle$ and p is a real number. Let S be the sphere of radius a centered at the origin. Show that the outward flux of $\mathbf{F}$ across the sphere is $4\pi/a^{p-3}$. It is instructive to do the calculation using both an explicit and a parametric description of the sphere.

61–63. Heat flux The heat flow vector field for conducting objects is $\mathbf{F} = -k\nabla T$, where $T(x, y, z)$ is the temperature in the object and $k > 0$ is a constant that depends on the material. Compute the outward flux of $\mathbf{F}$ across the following surfaces S for the given temperature distributions. Assume $k = 1$.

61. $T(x, y, z) = 100e^{-x-y}$; S consists of the faces of the cube $|x| \leq 1$, $|y| \leq 1$, $|z| \leq 1$.

62. $T(x, y, z) = 100e^{-x^2-y^2-z^2}$; S is the sphere $x^2 + y^2 + z^2 = a^2$.

63. $T(x, y, z) = -\ln(x^2 + y^2 + z^2)$; S is the sphere $x^2 + y^2 + z^2 = a^2$.

64. Flux across a cylinder Let S be the cylinder $x^2 + y^2 = a^2$, for $-L \leq z \leq L$.

- Find the outward flux of the field $\mathbf{F} = \langle x, y, 0 \rangle$ across S .
- Find the outward flux of the field $\mathbf{F} = \frac{\langle x, y, 0 \rangle}{(x^2 + y^2)^{p/2}} = \frac{\mathbf{r}}{|\mathbf{r}|^p}$ across S , where $|\mathbf{r}|$ is the distance from the z -axis and p is a real number.
- In part (b), for what values of p is the outward flux finite as $a \rightarrow \infty$ (with L fixed)?
- In part (b), for what values of p is the outward flux finite as $L \rightarrow \infty$ (with a fixed)?

65. Flux across concentric spheres Consider the radial fields

$$\mathbf{F} = \frac{\langle x, y, z \rangle}{(x^2 + y^2 + z^2)^{p/2}} = \frac{\mathbf{r}}{|\mathbf{r}|^p}, \text{ where } p \text{ is a real number. Let}$$

S consist of the spheres A and B centered at the origin with radii $0 < a < b$, respectively. The total outward flux across S consists of the flux out of S across the outer sphere B minus the flux into S across the inner sphere A .

- Find the total flux across S with $p = 0$. Interpret the result.
- Show that for $p = 3$ (an inverse square law), the flux across S is independent of a and b .

66–69. Mass and center of mass Let S be a surface that represents a thin shell with density ρ . The moments about the coordinate planes (see Section 16.6) are $M_{yz} = \iint_S x\rho(x, y, z) dS$, $M_{xz} = \iint_S y\rho(x, y, z) dS$, and $M_{xy} = \iint_S z\rho(x, y, z) dS$. The coordinates of the center of mass of the shell are $\bar{x} = \frac{M_{yz}}{m}$, $\bar{y} = \frac{M_{xz}}{m}$, and $\bar{z} = \frac{M_{xy}}{m}$, where m is the mass of the shell. Find the mass and center of mass of the following shells. Use symmetry whenever possible.

- The constant-density hemispherical shell $x^2 + y^2 + z^2 = a^2$, $z \geq 0$
- The constant-density cone with radius a , height h , and base in the xy -plane
- The constant-density half-cylinder $x^2 + z^2 = a^2$, $-\frac{h}{2} \leq y \leq \frac{h}{2}$, $z \geq 0$
- The cylinder $x^2 + y^2 = a^2$, $0 \leq z \leq 2$, with density $\rho(x, y, z) = 1 + z$

70. Outward normal to a sphere Show that $|\mathbf{t}_u \times \mathbf{t}_v| = a^2 \sin u$ for a sphere of radius a defined parametrically by $\mathbf{r}(u, v) = \langle a \sin u \cos v, a \sin u \sin v, a \cos u \rangle$, where $0 \leq u \leq \pi$ and $0 \leq v \leq 2\pi$.

71. Special case of surface integrals of scalar-valued functions

Suppose a surface S is defined as $z = g(x, y)$ on a region R . Show that $\mathbf{t}_x \times \mathbf{t}_y = \langle -z_x, -z_y, 1 \rangle$ and that

$$\iint_S f(x, y, z) dS = \iint_R f(x, y, g(x, y)) \sqrt{z_x^2 + z_y^2 + 1} dA.$$

72. Surfaces of revolution Suppose $y = f(x)$ is a continuous and positive function on $[a, b]$. Let S be the surface generated when the graph of f on $[a, b]$ is revolved about the x -axis.

- Show that S is described parametrically by $\mathbf{r}(u, v) = \langle u, f(u) \cos v, f(u) \sin v \rangle$, for $a \leq u \leq b$, $0 \leq v \leq 2\pi$.
- Find an integral that gives the surface area of S .
- Apply the result of part (b) to the surface generated with $f(x) = x^3$, for $1 \leq x \leq 2$.
- Apply the result of part (b) to the surface generated with $f(x) = (25 - x^2)^{1/2}$, for $3 \leq x \leq 4$.

73. Rain on roofs Let $z = s(x, y)$ define a surface over a region R in the xy -plane, where $z \geq 0$ on R . Show that the downward flux of the vertical vector field $\mathbf{F} = \langle 0, 0, -1 \rangle$ across S equals the area of R . Interpret the result physically.

74. Surface area of a torus

- Show that a torus with radii $R > r$ (see figure) may be described parametrically by $\mathbf{r}(u, v) = \langle (R + r \cos u) \cos v, (R + r \cos u) \sin v, r \sin u \rangle$, for $0 \leq u \leq 2\pi$, $0 \leq v \leq 2\pi$.
- Show that the surface area of the torus is $4\pi^2 Rr$.

75. Surfaces of revolution—single variable Let f be differentiable and positive on the interval $[a, b]$. Let S be the surface generated when the graph of f on $[a, b]$ is revolved about the x -axis. Use Theorem 17.14 to show that the area of S (as given in Section 6.6) is

$$\int_a^b 2\pi f(x) \sqrt{1 + f'(x)^2} dx.$$

QUICK CHECK ANSWERS

- A half-cylinder with height 1 and radius 2 with its axis along the z -axis
- A half-cone with height 10 and radius 10
- A quarter-sphere with radius 4
- $\sqrt{2}$
- The cylinder $x^2 + y^2 = a^2$ does not represent a function, so z_x and z_y cannot be computed.
- The vector field is everywhere orthogonal to the hemisphere, so the hemisphere has maximum flux at every point. ◀

17.7 Stokes' Theorem

► Born in Ireland, George Gabriel Stokes (1819–1903) led a long and distinguished life as one of the prominent mathematicians and physicists of his day. He entered Cambridge University as a student and remained there as a professor for most of his life, taking the Lucasian chair of mathematics once held by Sir Isaac Newton. The first statement of Stokes' Theorem was given by William Thomson (Lord Kelvin).

With the divergence, the curl, and surface integrals in hand, we are ready to present two of the crowning results of calculus. Fortunately, all the heavy lifting has been done. In this section, you will see Stokes' Theorem, and in the next section, we present the Divergence Theorem.

Stokes' Theorem

Stokes' Theorem is the three-dimensional version of the circulation form of Green's Theorem. Recall that if C is a closed simple piecewise-smooth oriented curve in the xy -plane enclosing a simply connected region R , and $\mathbf{F} = \langle f, g \rangle$ is a differentiable vector field on R , then Green's Theorem says that

$$\underbrace{\oint_C \mathbf{F} \cdot d\mathbf{r}}_{\text{circulation}} = \iint_R \underbrace{(g_x - f_y)}_{\text{curl or rotation}} dA.$$

The line integral on the left gives the circulation along the boundary of R . The double integral on the right sums the curl of the vector field over all points of R . If $\mathbf{F}$ represents a fluid flow, the theorem says that the cumulative rotation of the flow within R equals the circulation along the boundary.

In Stokes' Theorem, the plane region R in Green's Theorem becomes an oriented surface S in $\mathbb{R}^3$. The circulation integral in Green's Theorem remains a circulation integral, but now over the closed simple piecewise-smooth oriented curve C that forms the boundary of S . The double integral of the curl in Green's Theorem becomes a surface integral of the three-dimensional curl (Figure 17.59).

Figure 17.59

Stokes' Theorem involves an oriented curve C and an oriented surface S on which there are two unit normal vectors at every point. These orientations must be consistent and the normal vectors must be chosen correctly. Here is the right-hand rule that relates the orientations of S and C and determines the choice of the normal vectors:

If the fingers of your right hand curl in the positive direction around C , then your right thumb points in the (general) direction of the vectors normal to S (Figure 17.60).

A common situation occurs when C has a counterclockwise orientation when viewed from above; then the vectors normal to S point upward.

Figure 17.60

► The right-hand rule tells you which of two normal vectors at a point of S to use. Remember that the direction of normal vectors changes continuously on an oriented surface.

THEOREM 17.15 Stokes' Theorem

Let S be an oriented surface in $\mathbb{R}^3$ with a piecewise-smooth closed boundary C whose orientation is consistent with that of S . Assume $\mathbf{F} = \langle f, g, h \rangle$ is a vector field whose components have continuous first partial derivatives on S . Then

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} dS,$$

where $\mathbf{n}$ is the unit vector normal to S determined by the orientation of S .

QUICK CHECK 1 Suppose S is a region in the xy -plane with a boundary oriented counterclockwise. What is the normal to S ? Explain why Stokes' Theorem becomes the circulation form of Green's Theorem. ◀

► Recall that for a constant nonzero vector $\mathbf{a}$ and the position vector $\mathbf{r} = \langle x, y, z \rangle$, the field $\mathbf{F} = \mathbf{a} \times \mathbf{r}$ is a rotation field. In Example 1,

$$\mathbf{F} = \langle 0, 1, 1 \rangle \times \langle x, y, z \rangle.$$

Figure 17.61

The meaning of Stokes' Theorem is much the same as for the circulation form of Green's Theorem: Under the proper conditions, the accumulated rotation of the vector field over the surface S (as given by the normal component of the curl) equals the net circulation on the boundary of S . An outline of the proof of Stokes' Theorem is given at the end of this section. First, we look at some special cases that give further insight into the theorem.

If $\mathbf{F}$ is a conservative vector field on a domain D , then it has a potential function φ such that $\mathbf{F} = \nabla \varphi$. Because $\nabla \times \nabla \varphi = \mathbf{0}$, it follows that $\nabla \times \mathbf{F} = \mathbf{0}$ (Theorem 17.11); therefore, the circulation integral is zero on all closed curves in D . Recall that the circulation integral is also a work integral for the force field $\mathbf{F}$, which emphasizes the fact that no work is done in moving an object on a closed path in a conservative force field. Among the important conservative vector fields are the radial fields $\mathbf{F} = \mathbf{r}/|\mathbf{r}|^p$, which generally have zero curl and zero circulation on closed curves.

EXAMPLE 1 Verifying Stokes' Theorem Confirm that Stokes' Theorem holds for the vector field $\mathbf{F} = \langle z - y, x, -x \rangle$, where S is the hemisphere $x^2 + y^2 + z^2 = 4$, for $z \geq 0$, and C is the circle $x^2 + y^2 = 4$ oriented counterclockwise.

SOLUTION The orientation of C implies that vectors normal to S should point in the outward direction. The vector field is a rotation field $\mathbf{a} \times \mathbf{r}$, where $\mathbf{a} = \langle 0, 1, 1 \rangle$ and $\mathbf{r} = \langle x, y, z \rangle$; so the axis of rotation points in the direction of the vector $\langle 0, 1, 1 \rangle$ (Figure 17.61). We first compute the circulation integral in Stokes' Theorem. The curve C with the given orientation is parameterized as $\mathbf{r}(t) = \langle 2 \cos t, 2 \sin t, 0 \rangle$, for $0 \leq t \leq 2\pi$; therefore, $\mathbf{r}'(t) = \langle -2 \sin t, 2 \cos t, 0 \rangle$. The circulation integral is

$$\begin{aligned} \oint_C \mathbf{F} \cdot d\mathbf{r} &= \int_0^{2\pi} \mathbf{F} \cdot \mathbf{r}'(t) \, dt && \text{Definition of line integral} \\ &= \int_0^{2\pi} \underbrace{\langle z - y, x, -x \rangle}_{\langle -2 \sin t, 2 \cos t, 0 \rangle} \cdot \langle -2 \sin t, 2 \cos t, 0 \rangle \, dt && \text{Substitute.} \\ &= \int_0^{2\pi} 4(\sin^2 t + \cos^2 t) \, dt && \text{Simplify.} \\ &= 4 \int_0^{2\pi} dt && \sin^2 t + \cos^2 t = 1 \\ &= 8\pi. && \text{Evaluate integral.} \end{aligned}$$

The surface integral requires computing the curl of the vector field:

$$\nabla \times \mathbf{F} = \nabla \times \langle z - y, x, -x \rangle = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ z - y & x & -x \end{vmatrix} = \langle 0, 2, 2 \rangle.$$

Recall from Section 17.6 (Table 17.3) that the required outward normal to the hemisphere is $\langle x/z, y/z, 1 \rangle$. The region of integration is the base of the hemisphere in the xy -plane, which is

$$R = \{(x, y): x^2 + y^2 \leq 4\}, \text{ or, in polar coordinates, } \{(r, \theta): 0 \leq r \leq 2, 0 \leq \theta \leq 2\pi\}.$$

Combining these results, the surface integral in Stokes' Theorem is

$$\begin{aligned} \iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS &= \iint_R \langle 0, 2, 2 \rangle \cdot \left\langle \frac{x}{z}, \frac{y}{z}, 1 \right\rangle dA && \text{Substitute and convert to a double integral over } R. \\ &= \iint_R \left(\frac{2y}{\sqrt{4 - x^2 - y^2}} + 2 \right) dA && \text{Simplify and use } z = \sqrt{4 - x^2 - y^2}. \\ &= \int_0^{2\pi} \int_0^2 \left(\frac{2r \sin \theta}{\sqrt{4 - r^2}} + 2 \right) r \, dr \, d\theta. && \text{Convert to polar coordinates.} \end{aligned}$$

- In eliminating the first term of this double integral, we note that the improper integral $\int_0^2 \frac{r^2}{\sqrt{4-r^2}} dr$ has a finite value.

We integrate first with respect to θ because the integral of $\sin \theta$ from 0 to 2π is zero and the first term in the integral is eliminated. Therefore, the surface integral reduces to

$$\begin{aligned} \iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS &= \int_0^2 \int_0^{2\pi} \left(\frac{2r^2 \sin \theta}{\sqrt{4-r^2}} + 2r \right) d\theta \, dr \\ &= \int_0^2 \int_0^{2\pi} 2r \, d\theta \, dr && \int_0^{2\pi} \sin \theta \, d\theta = 0 \\ &= 4\pi \int_0^2 r \, dr && \text{Evaluate inner integral.} \\ &= 8\pi. && \text{Evaluate outer integral.} \end{aligned}$$

Computed either as a line integral or as a surface integral, the vector field has a positive circulation along the boundary of S , which is produced by the net rotation of the field over the surface S .

Related Exercises 5–6 ◀

In Example 1, it was possible to evaluate both the line integral and the surface integral that appear in Stokes' Theorem. Often the theorem provides an easier way to evaluate difficult line integrals.

Figure 17.62

- Recall that for an explicitly defined surface S given by $z = s(x, y)$ over a region R with $\mathbf{F} = \langle f, g, h \rangle$,

$$\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = \iint_R (-fz_x - gz_y + h) \, dA.$$

In Example 2, $\mathbf{F}$ is replaced with $\nabla \times \mathbf{F}$.

EXAMPLE 2 Using Stokes' Theorem to evaluate a line integral Evaluate the line integral $\oint_C \mathbf{F} \cdot d\mathbf{r}$, where $\mathbf{F} = z\mathbf{i} - z\mathbf{j} + (x^2 - y^2)\mathbf{k}$ and C consists of the three line segments that bound the plane $z = 8 - 4x - 2y$ in the first octant, oriented as shown in Figure 17.62.

SOLUTION Evaluating the line integral directly involves parameterizing the three line segments. Instead, we use Stokes' Theorem to convert the line integral to a surface integral, where S is that portion of the plane $z = 8 - 4x - 2y$ that lies in the first octant. The curl of the vector field is

$$\nabla \times \mathbf{F} = \nabla \times \langle z, -z, x^2 - y^2 \rangle = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ z & -z & x^2 - y^2 \end{vmatrix} = \langle 1 - 2y, 1 - 2x, 0 \rangle.$$

The appropriate vector normal to the plane $z = 8 - 4x - 2y$ is $\langle -z_x, -z_y, 1 \rangle = \langle 4, 2, 1 \rangle$, which points upward, consistent with the orientation of C . The triangular region R in the xy -plane beneath S is found by setting $z = 0$ in the equation of the plane; we find that $R = \{(x, y): 0 \leq x \leq 2, 0 \leq y \leq 4 - 2x\}$. The surface integral in Stokes' Theorem may now be evaluated:

$$\begin{aligned} \iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS &= \iint_R \langle 1 - 2y, 1 - 2x, 0 \rangle \cdot \langle 4, 2, 1 \rangle \, dA && \text{Substitute and convert to a double integral over } R. \\ &= \int_0^2 \int_0^{4-2x} (6 - 4x - 8y) \, dy \, dx && \text{Simplify.} \\ &= -\frac{88}{3}. && \text{Evaluate integrals.} \end{aligned}$$

The circulation around the boundary of R is negative, indicating a net circulation in the clockwise direction on C (looking from above).

Related Exercises 13, 16 ◀

In other situations, Stokes' Theorem may be used to convert a difficult surface integral into a relatively easy line integral, as illustrated in the next example.

Figure 17.63

EXAMPLE 3 Using Stokes' Theorem to evaluate a surface integral Evaluate $\iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS$, where $\mathbf{F} = -y \mathbf{i} + x \mathbf{j} + z \mathbf{k}$, in the following cases.

- S is the part of the paraboloid $z = 4 - x^2 - 3y^2$ that lies within the paraboloid $z = 3x^2 + y^2$ (the blue surface in Figure 17.63). Assume $\mathbf{n}$ points in the upward direction on S .
- S is the part of the paraboloid $z = 3x^2 + y^2$ that lies within the paraboloid $z = 4 - x^2 - 3y^2$, with $\mathbf{n}$ pointing in the upward direction on S .
- S is the surface in part (b), with $\mathbf{n}$ pointing in the downward direction on S .

SOLUTION

a. Finding a parametric description for S is challenging, so we use Stokes' Theorem to convert the surface integral into a line integral along the curve C that bounds S . Note that C is the intersection between the paraboloids $z = 4 - x^2 - 3y^2$ and $z = 3x^2 + y^2$. Eliminating z from these equations, we find that the projection of C onto the xy -plane is the circle $x^2 + y^2 = 1$, which suggests that we choose $x = \cos t$ and $y = \sin t$ for the x - and y -components of the equations for C . To find the z -component, we substitute x and y into the equation of either paraboloid. Choosing $z = 3x^2 + y^2$, we find that a parametric description of C is $\mathbf{r}(t) = \langle \cos t, \sin t, 3 \cos^2 t + \sin^2 t \rangle$; note that C is oriented in the counterclockwise direction, consistent with the orientation of S .

To evaluate the line integral in Stokes' Theorem, it is helpful to first compute $\mathbf{F} \cdot \mathbf{r}'(t)$. Along C , the vector field is $\mathbf{F} = \langle -y, x, z \rangle = \langle -\sin t, \cos t, 3 \cos^2 t + \sin^2 t \rangle$. Differentiating $\mathbf{r}$ yields $\mathbf{r}'(t) = \langle -\sin t, \cos t, -4 \cos t \sin t \rangle$, which leads to

$$\begin{aligned} \mathbf{F} \cdot \mathbf{r}'(t) &= \langle -\sin t, \cos t, 3 \cos^2 t + \sin^2 t \rangle \cdot \langle -\sin t, \cos t, -4 \cos t \sin t \rangle \\ &= \underbrace{\sin^2 t + \cos^2 t}_1 - 12 \cos^3 t \sin t - 4 \sin^3 t \cos t. \end{aligned}$$

Noting that $\sin^2 t + \cos^2 t = 1$, we are ready to evaluate the integral:

$$\begin{aligned} \iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS &= \oint_C \mathbf{F} \cdot d\mathbf{r} && \text{Stokes' Theorem} \\ &= \int_0^{2\pi} \mathbf{F} \cdot \mathbf{r}'(t) \, dt && \text{Definition of line integral} \\ &= \int_0^{2\pi} (1 - 12 \cos^3 t \sin t - 4 \cos t \sin^3 t) \, dt && \text{Substitute.} \\ &= \int_0^{2\pi} 1 \, dt - \underbrace{\int_0^{2\pi} 12 \cos^3 t \sin t \, dt}_0 - \underbrace{\int_0^{2\pi} 4 \cos t \sin^3 t \, dt}_0 && \text{Split integral.} \\ &= 2\pi. && \text{Evaluate integrals.} \end{aligned}$$

A standard substitution in the last two integrals of the final step shows that both integrals equal 0.

- Because the lower surface ($z = 3x^2 + y^2$) shares the same boundary C with the upper surface ($z = 4 - x^2 - 3y^2$), and because both surfaces have an upward-pointing normal vector, the line integral resulting from an application of Stokes' Theorem is identical to the integral in part (a). For this surface S with its associated normal vector, we conclude that $\iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS = \oint_C \mathbf{F} \cdot d\mathbf{r} = 2\pi$. In fact, the value of this integral is 2π for any surface whose boundary is C and whose normal vectors point in the upward direction.
- In this case, $\mathbf{n}$ points downward. We use the parameterization $\mathbf{r}(t) = \langle \sin t, \cos t, 3 \cos^2 t + \sin^2 t \rangle$ for C so that C is oriented in the clockwise direction, consistent with the orientation of S . You should verify that, when duplicating the calculations in part (a) with a new description for C , we have

$$\mathbf{F} \cdot \mathbf{r}'(t) = \underbrace{-\sin^2 t - \cos^2 t}_{-1} - 12 \cos^3 t \sin t - 4 \sin^3 t \cos t.$$

► Recall that $x = \cos t$, $y = \sin t$ is a standard parameterization for the unit circle centered at the origin with counterclockwise orientation. The parameterization $x = \sin t$, $y = \cos t$ reverses the orientation.

Therefore, the required integral is

$$\begin{aligned}\iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS &= \oint_C \mathbf{F} \cdot d\mathbf{r} = \int_0^{2\pi} \mathbf{F} \cdot \mathbf{r}'(t) \, dt \\ &= \int_0^{2\pi} (-1 - 12 \cos^3 t \sin t - 4 \cos t \sin^3 t) \, dt \\ &= -2\pi.\end{aligned}$$

QUICK CHECK 2 In Example 3a, we used the parameterization $\mathbf{r}(t) = \langle \cos t, \sin t, 3 \cos^2 t + \sin^2 t \rangle$ for C . Confirm that the parameterization $C: \mathbf{r}(t) = \langle \cos t, \sin t, 4 - \cos^2 t - 3 \sin^2 t \rangle$ also results in an answer of 2π . ◀

This result is perhaps not surprising when compared to parts (a) and (b): The reversal of the orientation of S requires a reversal of the orientation of C , and we know from Section 17.2 that $\int_C \mathbf{F} \cdot d\mathbf{r} = -\int_{-C} \mathbf{F} \cdot d\mathbf{r}$. As we discuss at the end of this section, it follows that the surface integral over the closed surface enclosed by *both* paraboloids (with normal vectors everywhere outward) has the value $2\pi - 2\pi = 0$.

Related Exercises 21–22 ◀

Interpreting the Curl

Stokes' Theorem leads to another interpretation of the curl at a point in a vector field. We need the idea of the **average circulation**. If C is the boundary of an oriented surface S , we define the average circulation of $\mathbf{F}$ over S as

$$\frac{1}{\text{area of } S} \oint_C \mathbf{F} \cdot d\mathbf{r} = \frac{1}{\text{area of } S} \iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS,$$

where Stokes' Theorem is used to convert the circulation integral to a surface integral.

First consider a general rotation field $\mathbf{F} = \mathbf{a} \times \mathbf{r}$, where $\mathbf{a} = \langle a_1, a_2, a_3 \rangle$ is a constant nonzero vector and $\mathbf{r} = \langle x, y, z \rangle$. Recall that $\mathbf{F}$ describes the rotation about an axis in the direction of $\mathbf{a}$ with angular speed $\omega = |\mathbf{a}|$. We also showed that $\mathbf{F}$ has a constant curl, $\nabla \times \mathbf{F} = \nabla \times (\mathbf{a} \times \mathbf{r}) = 2\mathbf{a}$. We now take S to be a small circular disk centered at a point P , whose normal vector $\mathbf{n}$ makes an angle θ with the axis $\mathbf{a}$ (Figure 17.64). Let C be the boundary of S with a counterclockwise orientation.

The average circulation of this vector field on S is

$$\begin{aligned}\frac{1}{\text{area of } S} \iint_S \underbrace{(\nabla \times \mathbf{F}) \cdot \mathbf{n}}_{\text{constant}} \, dS &\quad \text{Definition} \\ &= \frac{1}{\text{area of } S} (\nabla \times \mathbf{F}) \cdot \mathbf{n} \cdot \text{area of } S \quad \iint_S dS = \text{area of } S \\ &= \underbrace{(\nabla \times \mathbf{F}) \cdot \mathbf{n}}_{2\mathbf{a}} \quad \text{Simplify.} \\ &= 2|\mathbf{a}| \cos \theta. \quad |\mathbf{n}| = 1, |\nabla \times \mathbf{F}| = 2|\mathbf{a}|\end{aligned}$$

If the normal vector $\mathbf{n}$ is aligned with $\nabla \times \mathbf{F}$ (which is parallel to $\mathbf{a}$), then $\theta = 0$ and the average circulation on S has its maximum value of $2|\mathbf{a}|$. However, if the vector normal to the surface S is orthogonal to the axis of rotation ($\theta = \pi/2$), the average circulation is zero.

We see that for a general rotation field $\mathbf{F} = \mathbf{a} \times \mathbf{r}$, the curl of $\mathbf{F}$ has the following interpretations, where S is a small disk centered at a point P with a normal vector $\mathbf{n}$.

- The scalar component of $\nabla \times \mathbf{F}$ at P in the direction of $\mathbf{n}$, which is $(\nabla \times \mathbf{F}) \cdot \mathbf{n} = 2|\mathbf{a}| \cos \theta$, is the average circulation of $\mathbf{F}$ on S .
- The direction of $\nabla \times \mathbf{F}$ at P is the direction that maximizes the average circulation of $\mathbf{F}$ on S . Equivalently, it is the direction in which the axis of a paddle wheel should be oriented to obtain the maximum angular speed.

A similar argument may be applied to a general vector field (with a variable curl) to give an analogous interpretation of the curl at a point (Exercise 48).

Figure 17.64

► Recall that $\mathbf{n}$ is a unit normal vector with $|\mathbf{n}| = 1$. By definition, the dot product gives $\mathbf{a} \cdot \mathbf{n} = |\mathbf{a}| \cos \theta$.

EXAMPLE 4 Horizontal channel flow Consider the velocity field

$\mathbf{v} = \langle 0, 1 - x^2, 0 \rangle$, for $|x| \leq 1$ and $|z| \leq 1$, which represents a horizontal flow in the y -direction (Figure 17.65a).

- a. Suppose you place a paddle wheel at the point $P(\frac{1}{2}, 0, 0)$. Using physical arguments, in which of the coordinate directions should the axis of the wheel point in order for the wheel to spin? In which direction does it spin? What happens if you place the wheel at $Q(-\frac{1}{2}, 0, 0)$?
- b. Compute and graph the curl of $\mathbf{v}$ and provide an interpretation.

Figure 17.65

SOLUTION

- a. If the axis of the wheel is aligned with the x -axis at P , the flow strikes the upper and lower halves of the wheel symmetrically and the wheel does not spin. If the axis of the wheel is aligned with the y -axis, the flow is parallel to the axis of the wheel and the wheel does not spin. If the axis of the wheel is aligned with the z -axis at P , the flow in the y -direction is greater for $x < \frac{1}{2}$ than it is for $x > \frac{1}{2}$. Therefore, a wheel located at $P(\frac{1}{2}, 0, 0)$ spins in the clockwise direction, looking from above (Figure 17.65a). Using a similar argument, we conclude that a vertically oriented paddle wheel placed at $Q(-\frac{1}{2}, 0, 0)$ spins in the counterclockwise direction (when viewed from above).
- b. A short calculation shows that

$$\nabla \times \mathbf{v} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ 0 & 1 - x^2 & 0 \end{vmatrix} = -2x \mathbf{k}.$$

QUICK CHECK 3 In Example 4, explain why a paddle wheel with its axis aligned with the z -axis does not spin when placed on the y -axis. ◀

As shown in Figure 17.65b, the curl points in the z -direction, which is the direction of the paddle wheel axis that gives the maximum angular speed of the wheel. Consider the z -component of the curl, which is $(\nabla \times \mathbf{v}) \cdot \mathbf{k} = -2x$. At $x = 0$, this component is zero, meaning the wheel does not spin at any point along the y -axis when its axis is aligned with the z -axis. For $x > 0$, we see that $(\nabla \times \mathbf{v}) \cdot \mathbf{k} < 0$, which corresponds to clockwise rotation of the vector field. For $x < 0$, we have $(\nabla \times \mathbf{v}) \cdot \mathbf{k} > 0$, corresponding to counterclockwise rotation.

Related Exercise 26 ◀

Figure 17.66

Proof of Stokes' Theorem

The proof of the most general case of Stokes' Theorem is intricate. However, a proof of a special case is instructive and relies on several previous results.

Consider the case in which the surface S is the graph of the function $z = s(x, y)$, defined on a region in the xy -plane. Let C be the curve that bounds S with a counterclockwise orientation, let R be the projection of S in the xy -plane, and let C' be the projection of C in the xy -plane (Figure 17.66).

Letting $\mathbf{F} = \langle f, g, h \rangle$, the line integral in Stokes' Theorem is

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \oint_C f dx + g dy + h dz.$$

The key observation for this integral is that along C (which is the boundary of S), $dz = z_x dx + z_y dy$. Making this substitution, we convert the line integral on C to a line integral on C' in the xy -plane:

$$\begin{aligned} \oint_C \mathbf{F} \cdot d\mathbf{r} &= \oint_{C'} f dx + g dy + \underbrace{h(z_x dx + z_y dy)}_{dz} \\ &= \oint_{C'} \underbrace{(f + h z_x)}_{M(x, y)} dx + \underbrace{(g + h z_y)}_{N(x, y)} dy. \end{aligned}$$

We now apply the circulation form of Green's Theorem to this line integral with $M(x, y) = f + h z_x$ and $N(x, y) = g + h z_y$; the result is

$$\oint_{C'} M dx + N dy = \iint_R (N_x - M_y) dA.$$

A careful application of the Chain Rule (remembering that z is a function of x and y , Exercise 49) reveals that

$$\begin{aligned} M_y &= f_y + f_z z_y + h z_{xy} + z_x(h_y + h_z z_y) \quad \text{and} \\ N_x &= g_x + g_z z_x + h z_{yx} + z_y(h_x + h_z z_x). \end{aligned}$$

Making these substitutions in the line integral and simplifying (note that $z_{xy} = z_{yx}$ is needed), we have

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_R (z_x(g_z - h_y) + z_y(h_x - f_z) + (g_x - f_y)) dA. \quad (1)$$

Now let's look at the surface integral in Stokes' Theorem. The upward vector normal to the surface is $\langle -z_x, -z_y, 1 \rangle$. Substituting the components of $\nabla \times \mathbf{F}$, the surface integral takes the form

$$\iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} dS = \iint_R ((h_y - g_z)(-z_x) + (f_z - h_x)(-z_y) + (g_x - f_y)) dA,$$

which upon rearrangement becomes the integral in (1).

Two Final Notes on Stokes' Theorem

1. Stokes' Theorem allows a surface integral $\iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} dS$ to be evaluated using only the values of the vector field on the boundary C . This means that if a closed curve C is the boundary of two different smooth oriented surfaces S_1 and S_2 , which both have an orientation consistent with that of C , then the integrals of $(\nabla \times \mathbf{F}) \cdot \mathbf{n}$ on the two surfaces are equal; that is,

$$\iint_{S_1} (\nabla \times \mathbf{F}) \cdot \mathbf{n}_1 dS = \iint_{S_2} (\nabla \times \mathbf{F}) \cdot \mathbf{n}_2 dS,$$

where $\mathbf{n}_1$ and $\mathbf{n}_2$ are the respective unit normal vectors consistent with the orientation of the surfaces (Figure 17.67a; see Example 3).

Figure 17.67

Now let's take a different perspective. Suppose S is a *closed* surface consisting of S_1 and S_2 with a common boundary curve C (Figure 17.67b). Let $\mathbf{n}$ represent the outward unit normal vector for the entire surface S . It follows that $\mathbf{n}$ points in the same direction as $\mathbf{n}_1$ and in the direction opposite to that of $\mathbf{n}_2$ (Figure 17.67b). Therefore, $\iint_{S_1} (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS$ and $\iint_{S_2} (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS$ are equal in magnitude and of opposite sign, from which we conclude that

$$\iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS = \iint_{S_1} (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS + \iint_{S_2} (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS = 0.$$

This argument can be adapted to show that $\iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS = 0$ over any closed oriented surface S (Exercise 50).

2. We can now resolve an assertion made in Section 17.5. There we proved (Theorem 17.11) that if $\mathbf{F}$ is a conservative vector field, then $\nabla \times \mathbf{F} = \mathbf{0}$; we claimed, but did not prove, that the converse is true. The converse follows directly from Stokes' Theorem.

THEOREM 17.16 **Curl $\mathbf{F} = \mathbf{0}$ Implies $\mathbf{F}$ Is Conservative**

Suppose $\nabla \times \mathbf{F} = \mathbf{0}$ throughout an open simply connected region D of $\mathbb{R}^3$. Then $\oint_C \mathbf{F} \cdot d\mathbf{r} = 0$ on all closed simple smooth curves C in D , and $\mathbf{F}$ is a conservative vector field on D .

Proof: Given a closed simple smooth curve C , an advanced result states that C is the boundary of at least one smooth oriented surface S in D . By Stokes' Theorem,

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS = 0.$$

Because the line integral equals zero over all such curves in D , the vector field is conservative on D by Theorem 17.6. 

SECTION 17.7 EXERCISES

Getting Started

1. Explain the meaning of the integral $\oint_C \mathbf{F} \cdot d\mathbf{r}$ in Stokes' Theorem.
2. Explain the meaning of the integral $\iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS$ in Stokes' Theorem.
3. Explain the meaning of Stokes' Theorem.
4. Why does a conservative vector field produce zero circulation around a closed curve?

Practice Exercises

5–10. Verifying Stokes' Theorem Verify that the line integral and the surface integral of Stokes' Theorem are equal for the following vector fields, surfaces S , and closed curves C . Assume C has counterclockwise orientation and S has a consistent orientation.

5. $\mathbf{F} = \langle y, -x, 10 \rangle$; S is the upper half of the sphere $x^2 + y^2 + z^2 = 1$ and C is the circle $x^2 + y^2 = 1$ in the xy -plane.
6. $\mathbf{F} = \langle 0, -x, y \rangle$; S is the upper half of the sphere $x^2 + y^2 + z^2 = 4$ and C is the circle $x^2 + y^2 = 4$ in the xy -plane.
7. $\mathbf{F} = \langle x, y, z \rangle$; S is the paraboloid $z = 8 - x^2 - y^2$, for $0 \leq z \leq 8$, and C is the circle $x^2 + y^2 = 8$ in the xy -plane.
8. $\mathbf{F} = \langle 2z, -4x, 3y \rangle$; S is the cap of the sphere $x^2 + y^2 + z^2 = 169$ above the plane $z = 12$ and C is the boundary of S .
9. $\mathbf{F} = \langle y - z, z - x, x - y \rangle$; S is the cap of the sphere $x^2 + y^2 + z^2 = 16$ above the plane $z = \sqrt{7}$ and C is the boundary of S .
10. $\mathbf{F} = \langle -y, -x - z, y - x \rangle$; S is the part of the plane $z = 6 - y$ that lies in the cylinder $x^2 + y^2 = 16$ and C is the boundary of S .

11–16. Stokes' Theorem for evaluating line integrals Evaluate the line integral $\oint_C \mathbf{F} \cdot d\mathbf{r}$ by evaluating the surface integral in Stokes' Theorem with an appropriate choice of S . Assume C has a counterclockwise orientation.

11. $\mathbf{F} = \langle 2y, -z, x \rangle$; C is the circle $x^2 + y^2 = 12$ in the plane $z = 0$.
12. $\mathbf{F} = \langle y, xz, -y \rangle$; C is the ellipse $x^2 + y^2/4 = 1$ in the plane $z = 1$.
13. $\mathbf{F} = \langle x^2 - z^2, y, 2xz \rangle$; C is the boundary of the plane $z = 4 - x - y$ in the first octant.
14. $\mathbf{F} = \langle x^2 - y^2, z^2 - x^2, y^2 - z^2 \rangle$; C is the boundary of the square $|x| \leq 1, |y| \leq 1$ in the plane $z = 0$.

15. $\mathbf{F} = \langle y^2, -z^2, x \rangle$; C is the circle $\mathbf{r}(t) = \langle 3 \cos t, 4 \cos t, 5 \sin t \rangle$, for $0 \leq t \leq 2\pi$.

16. $\mathbf{F} = \langle 2xy \sin z, x^2 \sin z, x^2 y \cos z \rangle$; C is the boundary of the plane $z = 8 - 2x - 4y$ in the first octant.

17–24. Stokes' Theorem for evaluating surface integrals Evaluate the line integral in Stokes' Theorem to determine the value of the surface integral $\iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS$. Assume $\mathbf{n}$ points in an upward direction.

17. $\mathbf{F} = \langle x, y, z \rangle$; S is the upper half of the ellipsoid $x^2/4 + y^2/9 + z^2 = 1$.

18. $\mathbf{F} = \mathbf{r}/|\mathbf{r}|$; S is the paraboloid $x = 9 - y^2 - z^2$, for $0 \leq x \leq 9$ (excluding its base), and $\mathbf{r} = \langle x, y, z \rangle$.

19. $\mathbf{F} = \langle 2y, -z, x - y - z \rangle$; S is the cap of the sphere $x^2 + y^2 + z^2 = 25$, for $3 \leq x \leq 5$ (excluding its base).

20. $\mathbf{F} = \langle x + y, y + z, z + x \rangle$; S is the tilted disk enclosed by $\mathbf{r}(t) = \langle \cos t, 2 \sin t, \sqrt{3} \cos t \rangle$.

21. $\mathbf{F} = \langle y, z - x, -y \rangle$; S is the part of the paraboloid $z = 2 - x^2 - 2y^2$ that lies within the cylinder $x^2 + y^2 = 1$.

22. $\mathbf{F} = \langle 4x, -8z, 4y \rangle$; S is the part of the paraboloid $z = 1 - 2x^2 - 3y^2$ that lies within the paraboloid $z = 2x^2 + y^2$.

23. $\mathbf{F} = \langle y, 1, z \rangle$; S is the part of the surface $z = 2\sqrt{x}$ that lies within the cone $z = \sqrt{x^2 + y^2}$.

24. $\mathbf{F} = \langle e^x, 1/z, y \rangle$; S is the part of the surface $z = 4 - 3y^2$ that lies within the paraboloid $z = x^2 + y^2$.

25–28. Interpreting and graphing the curl For the following velocity fields, compute the curl, make a sketch of the curl, and interpret the curl.

25. $\mathbf{v} = \langle 0, 0, y \rangle$

26. $\mathbf{v} = \langle 1 - z^2, 0, 0 \rangle$

27. $\mathbf{v} = \langle -2z, 0, 1 \rangle$

28. $\mathbf{v} = \langle 0, -z, y \rangle$

29. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.

- A paddle wheel with its axis in the direction $\langle 0, 1, -1 \rangle$ would not spin when put in the vector field $\mathbf{F} = \langle 1, 1, 2 \rangle \times \langle x, y, z \rangle$.
- Stokes' Theorem relates the flux of a vector field $\mathbf{F}$ across a surface to values of $\mathbf{F}$ on the boundary of the surface.
- A vector field of the form $\mathbf{F} = \langle a + f(x), b + g(y), c + h(z) \rangle$, where a, b , and c are constants, has zero circulation on a closed curve.
- If a vector field has zero circulation on all simple closed smooth curves C in a region D , then $\mathbf{F}$ is conservative on D .

30–33. Conservative fields Use Stokes' Theorem to find the circulation of the following vector fields around any simple closed smooth curve C .

30. $\mathbf{F} = \langle 2x, -2y, 2z \rangle$

31. $\mathbf{F} = \nabla(x \sin ye^z)$

32. $\mathbf{F} = \langle 3x^2y, x^3 + 2yz^2, 2y^2z \rangle$

33. $\mathbf{F} = \langle y^2z^3, 2xyz^3, 3xy^2z^2 \rangle$

34–38. Tilted disks Let S be the disk enclosed by the curve $C: \mathbf{r}(t) = \langle \cos \varphi \cos t, \sin t, \sin \varphi \cos t \rangle$, for $0 \leq t \leq 2\pi$, where $0 \leq \varphi \leq \pi/2$ is a fixed angle.

34. What is the area of S ? Find a vector normal to S .

35. What is the length of C ?

36. Use Stokes' Theorem and a surface integral to find the circulation on C of the vector field $\mathbf{F} = \langle -y, x, 0 \rangle$ as a function of φ . For what value of φ is the circulation a maximum?

37. What is the circulation on C of the vector field $\mathbf{F} = \langle -y, -z, x \rangle$ as a function of φ ? For what value of φ is the circulation a maximum?

38. Consider the vector field $\mathbf{F} = \mathbf{a} \times \mathbf{r}$, where $\mathbf{a} = \langle a_1, a_2, a_3 \rangle$ is a constant nonzero vector and $\mathbf{r} = \langle x, y, z \rangle$. Show that the circulation is a maximum when $\mathbf{a}$ points in the direction of the normal to S .

39. **Circulation in a plane** A circle C in the plane $x + y + z = 8$ has a radius of 4 and center $(2, 3, 3)$. Evaluate $\oint_C \mathbf{F} \cdot d\mathbf{r}$ for $\mathbf{F} = \langle 0, -z, 2y \rangle$, where C has a counterclockwise orientation when viewed from above. Does the circulation depend on the radius of the circle? Does it depend on the location of the center of the circle?

40. **No integrals** Let $\mathbf{F} = \langle 2z, z, 2y + x \rangle$, and let S be the hemisphere of radius a with its base in the xy -plane and center at the origin.

- Evaluate $\iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS$ by computing $\nabla \times \mathbf{F}$ and appealing to symmetry.
- Evaluate the line integral using Stokes' Theorem to check part (a).

41. **Compound surface and boundary** Begin with the paraboloid $z = x^2 + y^2$, for $0 \leq z \leq 4$, and slice it with the plane $y = 0$. Let S be the surface that remains for $y \geq 0$ (including the planar surface in the xz -plane) (see figure). Let C be the semicircle and line segment that bound the cap of S in the plane $z = 4$ with counterclockwise orientation. Let $\mathbf{F} = \langle 2z + y, 2x + z, 2y + x \rangle$.

- Describe the direction of the vectors normal to the surface that are consistent with the orientation of C .
- Evaluate $\iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS$.
- Evaluate $\oint_C \mathbf{F} \cdot d\mathbf{r}$ and check for agreement with part (b).

42. **Ampère's Law** The French physicist André-Marie Ampère (1775–1836) discovered that an electrical current I in a wire produces a magnetic field $\mathbf{B}$. A special case of Ampère's Law relates the current to the magnetic field through the equation $\oint_C \mathbf{B} \cdot d\mathbf{r} = \mu I$, where C is any closed curve through which the wire passes and μ is a physical constant. Assume the current I is given in terms of the current density $\mathbf{J}$ as $I = \iint_S \mathbf{J} \cdot \mathbf{n} \, dS$, where S is an oriented surface with C as a boundary. Use Stokes' Theorem to show that an equivalent form of Ampère's Law is $\nabla \times \mathbf{B} = \mu \mathbf{J}$.

43. **Maximum surface integral** Let S be the paraboloid $z = a(1 - x^2 - y^2)$, for $z \geq 0$, where $a > 0$ is a real number. Let $\mathbf{F} = \langle x - y, y + z, z - x \rangle$. For what value(s) of a (if any) does $\iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS$ have its maximum value?

Explorations and Challenges

44. Area of a region in a plane Let R be a region in a plane that has a unit normal vector $\mathbf{n} = \langle a, b, c \rangle$ and boundary C . Let $\mathbf{F} = \langle bz, cx, ay \rangle$.

- Show that $\nabla \times \mathbf{F} = \mathbf{n}$.
- Use Stokes' Theorem to show that

$$\text{area of } R = \oint_C \mathbf{F} \cdot d\mathbf{r}.$$

- Consider the curve C given by $\mathbf{r} = \langle 5 \sin t, 13 \cos t, 12 \sin t \rangle$, for $0 \leq t \leq 2\pi$. Prove that C lies in a plane by showing that $\mathbf{r} \times \mathbf{r}'$ is constant for all t .
- Use part (b) to find the area of the region enclosed by C in part (c). (*Hint:* Find the unit normal vector that is consistent with the orientation of C .)

45. Choosing a more convenient surface The goal is to evaluate $A = \iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS$, where $\mathbf{F} = \langle yz, -xz, xy \rangle$ and S is the surface of the upper half of the ellipsoid $x^2 + y^2 + 8z^2 = 1$ ($z \geq 0$).

- Evaluate a surface integral over a more convenient surface to find the value of A .
- Evaluate A using a line integral.

46. Radial fields and zero circulation Consider the radial vector fields $\mathbf{F} = \mathbf{r}/|\mathbf{r}|^p$, where p is a real number and $\mathbf{r} = \langle x, y, z \rangle$. Let C be any circle in the xy -plane centered at the origin.

- Evaluate a line integral to show that the field has zero circulation on C .
- For what values of p does Stokes' Theorem apply? For those values of p , use the surface integral in Stokes' Theorem to show that the field has zero circulation on C .

47. Zero curl Consider the vector field

$$\mathbf{F} = -\frac{y}{x^2 + y^2} \mathbf{i} + \frac{x}{x^2 + y^2} \mathbf{j} + z \mathbf{k}.$$

- Show that $\nabla \times \mathbf{F} = \mathbf{0}$.
- Show that $\oint_C \mathbf{F} \cdot d\mathbf{r}$ is not zero on a circle C in the xy -plane enclosing the origin.
- Explain why Stokes' Theorem does not apply in this case.

48. Average circulation Let S be a small circular disk of radius R centered at the point P with a unit normal vector $\mathbf{n}$. Let C be the boundary of S .

- Express the average circulation of the vector field $\mathbf{F}$ on S as a surface integral of $\nabla \times \mathbf{F}$.
- Argue that for small R , the average circulation approaches $(\nabla \times \mathbf{F})|_P \cdot \mathbf{n}$ (the component of $\nabla \times \mathbf{F}$ in the direction of $\mathbf{n}$ evaluated at P) with the approximation improving as $R \rightarrow 0$.

49. Proof of Stokes' Theorem Confirm the following step in the proof of Stokes' Theorem. If $z = s(x, y)$ and f, g , and h are functions of x, y , and z , with $M = f + hz_x$ and $N = g + hz_y$, then

$$M_y = f_y + f_{zy} + hz_{xy} + z_x(h_y + h_{zy}) \quad \text{and} \\ N_x = g_x + g_{zx} + hz_{yx} + z_y(h_x + h_{zx}).$$

50. Stokes' Theorem on closed surfaces Prove that if $\mathbf{F}$ satisfies the conditions of Stokes' Theorem, then $\iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS = 0$, where S is a smooth surface that encloses a region.

51. Rotated Green's Theorem Use Stokes' Theorem to write the circulation form of Green's Theorem in the yz -plane.

QUICK CHECK ANSWERS

- If S is a region in the xy -plane, $\mathbf{n} = \mathbf{k}$ and $(\nabla \times \mathbf{F}) \cdot \mathbf{n}$ becomes $g_x - f_y$.
- The vector field is symmetric about the y -axis. ◀

17.8 Divergence Theorem

Vector fields can represent electric or magnetic fields, air velocities in hurricanes, or blood flow in an artery. These and other vector phenomena suggest movement of a “substance.” A frequent question concerns the amount of a substance that flows across a surface—for example, the amount of water that passes across the membrane of a cell per unit time. Such flux calculations may be done using flux integrals as in Section 17.6. The Divergence Theorem offers an alternative method. In effect, it says that instead of integrating the flow into and out of a region across its boundary, you may also add up all the sources (or sinks) of the flow throughout the region.

Divergence Theorem

The Divergence Theorem is the three-dimensional version of the flux form of Green's Theorem. Recall that if R is a region in the xy -plane, C is the simple closed piecewise-smooth oriented boundary of R , and $\mathbf{F} = \langle f, g \rangle$ is a vector field, then Green's Theorem says that

$$\underbrace{\oint_C \mathbf{F} \cdot \mathbf{n} \, ds}_{\text{flux across } C} = \iint_R \underbrace{(f_x + g_y)}_{\text{divergence}} \, dA.$$

The line integral on the left gives the flux across the boundary of R . The double integral on the right measures the net expansion or contraction of the vector field within R . If $\mathbf{F}$ represents a fluid flow or the transport of a material, the theorem says that the cumulative effect of the sources (or sinks) of the flow within R equals the net flow across its boundary.

► Circulation form of Green's Theorem $\rightarrow$ Stokes' Theorem

Flux form of Green's Theorem $\rightarrow$ Divergence Theorem

The Divergence Theorem is a direct extension of Green's Theorem. The plane region in Green's Theorem becomes a solid region D in $\mathbb{R}^3$, and the closed curve in Green's Theorem becomes the oriented surface S that encloses D . The flux integral in Green's Theorem becomes a surface integral over S , and the double integral in Green's Theorem becomes a triple integral over D of the three-dimensional divergence (Figure 17.68).

Figure 17.68

THEOREM 17.17 Divergence Theorem

Let $\mathbf{F}$ be a vector field whose components have continuous first partial derivatives in a connected and simply connected region D in $\mathbb{R}^3$ enclosed by an oriented surface S . Then

$$\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = \iiint_D \nabla \cdot \mathbf{F} \, dV,$$

where $\mathbf{n}$ is the outward unit normal vector on S .

QUICK CHECK 1 Interpret the Divergence Theorem in the case that $\mathbf{F} = \langle a, b, c \rangle$ is a constant vector field and D is a ball. ◀

The surface integral on the left gives the flux of the vector field across the boundary; a positive flux integral means there is a net flow of the field out of the region. The triple integral on the right is the cumulative expansion or contraction of the field over the region D . The proof of a special case of the theorem is given later in this section.

EXAMPLE 1 Verifying the Divergence Theorem Consider the radial field $\mathbf{F} = \langle x, y, z \rangle$ and let S be the sphere $x^2 + y^2 + z^2 = a^2$ that encloses the region D . Assume $\mathbf{n}$ is the outward unit normal vector on the sphere. Evaluate both integrals of the Divergence Theorem.

SOLUTION The divergence of $\mathbf{F}$ is

$$\nabla \cdot \mathbf{F} = \frac{\partial}{\partial x}(x) + \frac{\partial}{\partial y}(y) + \frac{\partial}{\partial z}(z) = 3.$$

Integrating over D , we have

$$\iiint_D \nabla \cdot \mathbf{F} \, dV = \iiint_D 3 \, dV = 3 \times \text{volume of } D = 3 \cdot \frac{4}{3} \pi a^3 = 4\pi a^3.$$

To evaluate the surface integral, we parameterize the sphere (Section 17.6, Table 17.3) in the form

$$\mathbf{r} = \langle x, y, z \rangle = \langle a \sin u \cos v, a \sin u \sin v, a \cos u \rangle,$$

where $R = \{(u, v) : 0 \leq u \leq \pi, 0 \leq v \leq 2\pi\}$ (u and v are the spherical coordinates φ and θ , respectively). The surface integral is

$$\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = \iint_R \mathbf{F} \cdot (\mathbf{t}_u \times \mathbf{t}_v) \, dA,$$

where the required vector normal to the surface is

$$\mathbf{t}_u \times \mathbf{t}_v = \langle a^2 \sin^2 u \cos v, a^2 \sin^2 u \sin v, a^2 \sin u \cos u \rangle.$$

Substituting for $\mathbf{F} = \langle x, y, z \rangle$ and $\mathbf{t}_u \times \mathbf{t}_v$, we find after simplifying that $\mathbf{F} \cdot (\mathbf{t}_u \times \mathbf{t}_v) = a^3 \sin u$. Therefore, the surface integral becomes

► See Exercise 32 for an alternative evaluation of the surface integral.

$$\begin{aligned} \iint_S \mathbf{F} \cdot \mathbf{n} \, dS &= \iint_R \underbrace{\mathbf{F} \cdot (\mathbf{t}_u \times \mathbf{t}_v)}_{a^3 \sin u} \, dA \\ &= \int_0^{2\pi} \int_0^\pi a^3 \sin u \, du \, dv \quad \text{Substitute for } \mathbf{F} \text{ and } \mathbf{t}_u \times \mathbf{t}_v. \\ &= 4\pi a^3. \quad \text{Evaluate integrals.} \end{aligned}$$

The two integrals of the Divergence Theorem are equal.

Related Exercise 9 ◀

EXAMPLE 2 Divergence Theorem with a rotation field Consider the rotation field

$$\mathbf{F} = \mathbf{a} \times \mathbf{r} = \langle 1, 0, 1 \rangle \times \langle x, y, z \rangle = \langle -y, x - z, y \rangle.$$

Let S be the hemisphere $x^2 + y^2 + z^2 = a^2$, for $z \geq 0$, together with its base in the xy -plane. Find the net outward flux across S .

SOLUTION To find the flux using surface integrals, two surfaces must be considered (the hemisphere and its base). The Divergence Theorem gives a simpler solution. Note that

$$\nabla \cdot \mathbf{F} = \frac{\partial}{\partial x}(-y) + \frac{\partial}{\partial y}(x - z) + \frac{\partial}{\partial z}(y) = 0.$$

We see that the flux across the hemisphere is zero.

Related Exercise 13 ◀

With Stokes' Theorem, rotation fields are noteworthy because they have a nonzero curl. With the Divergence Theorem, the situation is reversed. As suggested by Example 2, pure rotation fields of the form $\mathbf{F} = \mathbf{a} \times \mathbf{r}$ have zero divergence (Exercise 16). However, with the Divergence Theorem, radial fields are interesting and have many physical applications.

EXAMPLE 3 Computing flux with the Divergence Theorem Find the net outward flux of the field $\mathbf{F} = xyz \langle 1, 1, 1 \rangle$ across the boundaries of the cube $D = \{(x, y, z): 0 \leq x \leq 1, 0 \leq y \leq 1, 0 \leq z \leq 1\}$.

SOLUTION Computing a surface integral involves the six faces of the cube. The Divergence Theorem gives the outward flux with a single integral over D . The divergence of the field is

$$\nabla \cdot \mathbf{F} = \frac{\partial}{\partial x}(xyz) + \frac{\partial}{\partial y}(xyz) + \frac{\partial}{\partial z}(xyz) = yz + xz + xy.$$

The integral over D is a standard triple integral:

$$\begin{aligned} \iiint_D \nabla \cdot \mathbf{F} \, dV &= \iiint_D (yz + xz + xy) \, dV \\ &= \int_0^1 \int_0^1 \int_0^1 (yz + xz + xy) \, dx \, dy \, dz \quad \text{Convert to a triple integral.} \\ &= \frac{3}{4}. \quad \text{Evaluate integrals.} \end{aligned}$$

On three faces of the cube (those that lie in the coordinate planes), we see that $\mathbf{F}(0, y, z) = \mathbf{F}(x, 0, z) = \mathbf{F}(x, y, 0) = \mathbf{0}$, so there is no contribution to the flux on these faces (Figure 17.69). On the other three faces, the vector field has components out of the cube. Therefore, the net outward flux is positive, as calculated.

Related Exercises 18–19 ◀

Figure 17.69

QUICK CHECK 2 In Example 3, does the vector field have negative components anywhere in the cube D ? Is the divergence negative anywhere in D ? ◀

- ▶ The mass transport is also called the *flux density*; when multiplied by an area, it gives the flux. We use the convention that flux has units of mass per unit time.
- ▶ Check the units: If $\mathbf{F}$ has units of mass/(area · time), then the flux has units of mass/time ($\mathbf{n}$ has no units).

Figure 17.70

Interpretation of the Divergence Theorem Using Mass Transport Suppose $\mathbf{v}$ is the velocity field of a material, such as water or molasses, and ρ is its constant density. The vector field $\mathbf{F} = \rho\mathbf{v} = \langle f, g, h \rangle$ describes the **mass transport** of the material, with units of (mass/vol) $\times$ (length/time) = mass/(area · time); typical units of mass transport are g/m²/s. This means that $\mathbf{F}$ gives the mass of material flowing past a point (in each of the three coordinate directions) per unit of surface area per unit of time. When $\mathbf{F}$ is multiplied by an area, the result is the **flux**, with units of mass/unit time.

Now consider a small cube located in the vector field with its faces parallel to the coordinate planes. One vertex is located at $(0, 0, 0)$, the opposite vertex is at $(\Delta x, \Delta y, \Delta z)$, and (x, y, z) is an arbitrary point in the cube (Figure 17.70). The goal is to compute the approximate flux of material across the faces of the cube. We begin with the flux across the two parallel faces $x = 0$ and $x = \Delta x$.

The outward unit vectors normal to the faces $x = 0$ and $x = \Delta x$ are $\mathbf{n}_1 = \langle -1, 0, 0 \rangle$ and $\mathbf{n}_2 = \langle 1, 0, 0 \rangle$, respectively. Each face has area $\Delta y \Delta z$, so the approximate net flux across these faces is

$$\begin{aligned} & \underbrace{\mathbf{F}(\Delta x, y, z)}_{x = \Delta x \text{ face}} \cdot \underbrace{\mathbf{n}_2}_{\langle 1, 0, 0 \rangle} \Delta y \Delta z + \underbrace{\mathbf{F}(0, y, z)}_{x = 0 \text{ face}} \cdot \underbrace{\mathbf{n}_1}_{\langle -1, 0, 0 \rangle} \Delta y \Delta z \\ &= (f(\Delta x, y, z) - f(0, y, z)) \Delta y \Delta z. \end{aligned}$$

Note that if $f(\Delta x, y, z) > f(0, y, z)$, the net flux across these two faces of the cube is positive, which means the net flow is *out* of the cube. Letting $\Delta V = \Delta x \Delta y \Delta z$ be the volume of the cube, we rewrite the net flux as

$$\begin{aligned} & (f(\Delta x, y, z) - f(0, y, z)) \Delta y \Delta z \\ &= \frac{f(\Delta x, y, z) - f(0, y, z)}{\Delta x} \Delta x \Delta y \Delta z \quad \text{Multiply by } \frac{\Delta x}{\Delta x}. \\ &= \frac{f(\Delta x, y, z) - f(0, y, z)}{\Delta x} \Delta V. \quad \Delta V = \Delta x \Delta y \Delta z \end{aligned}$$

A similar argument can be applied to the other two pairs of faces. The approximate net flux across the faces $y = 0$ and $y = \Delta y$ is

$$\frac{g(x, \Delta y, z) - g(x, 0, z)}{\Delta y} \Delta V,$$

and the approximate net flux across the faces $z = 0$ and $z = \Delta z$ is

$$\frac{h(x, y, \Delta z) - h(x, y, 0)}{\Delta z} \Delta V.$$

Adding these three individual fluxes gives the approximate net flux out of the cube:

$$\begin{aligned} \text{net flux out of cube} &\approx \left(\underbrace{\frac{f(\Delta x, y, z) - f(0, y, z)}{\Delta x}}_{\approx \frac{\partial f}{\partial x}(0, 0, 0)} + \underbrace{\frac{g(x, \Delta y, z) - g(x, 0, z)}{\Delta y}}_{\approx \frac{\partial g}{\partial y}(0, 0, 0)} \right. \\ &\quad \left. + \underbrace{\frac{h(x, y, \Delta z) - h(x, y, 0)}{\Delta z}}_{\approx \frac{\partial h}{\partial z}(0, 0, 0)} \right) \Delta V \\ &\approx \left(\frac{\partial f}{\partial x} + \frac{\partial g}{\partial y} + \frac{\partial h}{\partial z} \right) \Big|_{(0, 0, 0)} \Delta V \\ &= (\nabla \cdot \mathbf{F})(0, 0, 0) \Delta V. \end{aligned}$$

Notice how the three quotients approximate partial derivatives when Δx , Δy , and Δz are small. A similar argument may be made at any point in the region.

Taking one more step, we show informally how the Divergence Theorem arises. Suppose the small cube we just analyzed is one of many small cubes of volume ΔV that fill

► In making this argument, notice that for two adjacent cubes, the flux into one cube equals the flux out of the other cube across the common face. Therefore, there is a cancellation of fluxes throughout the interior of D .

QUICK CHECK 3 Draw the unit cube $D = \{(x, y, z): 0 \leq x \leq 1, 0 \leq y \leq 1, 0 \leq z \leq 1\}$ and sketch the vector field $\mathbf{F} = \langle x, -y, 2z \rangle$ on the six faces of the cube. Compute and interpret $\text{div } \mathbf{F}$. ◀

Figure 17.71

a region D . We label the cubes $k = 1, \dots, n$ and apply the preceding argument to each cube, letting $(\nabla \cdot \mathbf{F})_k$ be the divergence evaluated at a point in the k th cube. Adding the individual contributions to the net flux from each cube, we obtain the approximate net flux across the boundary of D :

$$\text{net flux out of } D \approx \sum_{k=1}^n (\nabla \cdot \mathbf{F})_k \Delta V.$$

Letting the volume of the cubes ΔV approach 0, and letting the number of cubes n increase, we obtain an integral over D :

$$\text{net flux out of } D = \lim_{n \rightarrow \infty} \sum_{k=1}^n (\nabla \cdot \mathbf{F})_k \Delta V = \iiint_D \nabla \cdot \mathbf{F} \, dV.$$

The net flux across the boundary of D is also given by $\iint_S \mathbf{F} \cdot \mathbf{n} \, dS$. Equating the surface integral and the volume integral gives the Divergence Theorem. Now we look at a formal proof.

Proof of the Divergence Theorem

We prove the Divergence Theorem under special conditions on the region D . Let R be the projection of D in the xy -plane (Figure 17.71); that is,

$$R = \{(x, y): (x, y, z) \text{ is in } D\}.$$

Assume the boundary of D is S and let $\mathbf{n}$ be the unit vector normal to S that points outward.

Letting $\mathbf{F} = \langle f, g, h \rangle = f\mathbf{i} + g\mathbf{j} + h\mathbf{k}$, the surface integral in the Divergence Theorem is

$$\begin{aligned} \iint_S \mathbf{F} \cdot \mathbf{n} \, dS &= \iint_S (f\mathbf{i} + g\mathbf{j} + h\mathbf{k}) \cdot \mathbf{n} \, dS \\ &= \iint_S f\mathbf{i} \cdot \mathbf{n} \, dS + \iint_S g\mathbf{j} \cdot \mathbf{n} \, dS + \iint_S h\mathbf{k} \cdot \mathbf{n} \, dS. \end{aligned}$$

The volume integral in the Divergence Theorem is

$$\iiint_D \nabla \cdot \mathbf{F} \, dV = \iiint_D \left(\frac{\partial f}{\partial x} + \frac{\partial g}{\partial y} + \frac{\partial h}{\partial z} \right) dV.$$

Matching terms of the surface and volume integrals, the theorem is proved by showing that

$$\iint_S f\mathbf{i} \cdot \mathbf{n} \, dS = \iiint_D \frac{\partial f}{\partial x} \, dV, \quad (1)$$

$$\iint_S g\mathbf{j} \cdot \mathbf{n} \, dS = \iiint_D \frac{\partial g}{\partial y} \, dV, \text{ and} \quad (2)$$

$$\iint_S h\mathbf{k} \cdot \mathbf{n} \, dS = \iiint_D \frac{\partial h}{\partial z} \, dV. \quad (3)$$

We work on equation (3) assuming special properties for D . Suppose D is bounded by two surfaces $S_1: z = p(x, y)$ and $S_2: z = q(x, y)$, where $p(x, y) \leq q(x, y)$ on R (Figure 17.71). The Fundamental Theorem of Calculus is used in the triple integral to show that

$$\begin{aligned} \iiint_D \frac{\partial h}{\partial z} \, dV &= \iint_R \int_{p(x, y)}^{q(x, y)} \frac{\partial h}{\partial z} \, dz \, dx \, dy \\ &= \iint_R (h(x, y, q(x, y)) - h(x, y, p(x, y))) \, dx \, dy. \quad \text{Evaluate inner integral.} \end{aligned}$$

Now let's turn to the surface integral in equation (3), $\iint_S h\mathbf{k} \cdot \mathbf{n} \, dS$, and note that S consists of three pieces: the lower surface S_1 , the upper surface S_2 , and the vertical sides S_3 of the surface (if they exist). The normal to S_3 is everywhere orthogonal to $\mathbf{k}$, so $\mathbf{k} \cdot \mathbf{n} = 0$

and the S_3 integral makes no contribution. What remains is to compute the surface integrals over S_1 and S_2 .

The required outward normal to S_2 (which is the graph of $z = q(x, y)$) is $\langle -q_x, -q_y, 1 \rangle$. The outward normal to S_1 (which is the graph of $z = p(x, y)$) points *downward*, so it is given by $\langle p_x, p_y, -1 \rangle$. The surface integral of (3) becomes

$$\begin{aligned} \iint_S h \mathbf{k} \cdot \mathbf{n} \, dS &= \iint_{S_2} h(x, y, z) \mathbf{k} \cdot \mathbf{n} \, dS + \iint_{S_1} h(x, y, z) \mathbf{k} \cdot \mathbf{n} \, dS \\ &= \iint_R h(x, y, q(x, y)) \underbrace{\mathbf{k} \cdot \langle -q_x, -q_y, 1 \rangle}_{1} \, dx \, dy \\ &\quad + \iint_R h(x, y, p(x, y)) \underbrace{\mathbf{k} \cdot \langle p_x, p_y, -1 \rangle}_{-1} \, dx \, dy \\ &= \iint_R h(x, y, q(x, y)) \, dx \, dy - \iint_R h(x, y, p(x, y)) \, dx \, dy. \quad \text{Simplify.} \end{aligned}$$

Observe that both the volume integral and the surface integral of (3) reduce to the same integral over R . Therefore, $\iint_S h \mathbf{k} \cdot \mathbf{n} \, dS = \iiint_D \frac{\partial h}{\partial z} \, dV$.

Equations (1) and (2) are handled in a similar way.

- To prove (1), we make the special assumption that D is also bounded by two surfaces, $S_1: x = s(y, z)$ and $S_2: x = t(y, z)$, where $s(y, z) \leq t(y, z)$.
- To prove (2), we assume D is bounded by two surfaces, $S_1: y = u(x, z)$ and $S_2: y = v(x, z)$, where $u(x, z) \leq v(x, z)$.

When combined, equations (1), (2), and (3) yield the Divergence Theorem. 

Divergence Theorem for Hollow Regions

The Divergence Theorem may be extended to more general solid regions. Here we consider the important case of hollow regions. Suppose D is a region consisting of all points inside a closed oriented surface S_2 and outside a closed oriented surface S_1 , where S_1 lies within S_2 (Figure 17.72). Therefore, the boundary of D consists of S_1 and S_2 , which we denote S . (Note that D is simply connected.)

We let $\mathbf{n}_1$ and $\mathbf{n}_2$ be the outward unit normal vectors for S_1 and S_2 , respectively. Note that $\mathbf{n}_1$ points into D , so the outward normal to S on S_1 is $-\mathbf{n}_1$. With this observation, the Divergence Theorem takes the following form.

THEOREM 17.18 Divergence Theorem for Hollow Regions

Suppose the vector field $\mathbf{F}$ satisfies the conditions of the Divergence Theorem on a region D bounded by two oriented surfaces S_1 and S_2 , where S_1 lies within S_2 . Let S be the entire boundary of D ($S = S_1 \cup S_2$) and let $\mathbf{n}_1$ and $\mathbf{n}_2$ be the outward unit normal vectors for S_1 and S_2 , respectively. Then

$$\iiint_D \nabla \cdot \mathbf{F} \, dV = \iint_S \mathbf{F} \cdot \mathbf{n} \, dS = \iint_{S_2} \mathbf{F} \cdot \mathbf{n}_2 \, dS - \iint_{S_1} \mathbf{F} \cdot \mathbf{n}_1 \, dS.$$

This form of the Divergence Theorem is applicable to vector fields that are not differentiable at the origin, as is the case with some important radial vector fields.

EXAMPLE 4 Flux for an inverse square field Consider the inverse square vector field

$$\mathbf{F} = \frac{\mathbf{r}}{|\mathbf{r}|^3} = \frac{\langle x, y, z \rangle}{(x^2 + y^2 + z^2)^{3/2}}.$$

$\mathbf{n}_1$ is the outward unit normal to S_1 and points into D . The outward unit normal to S on S_1 is $-\mathbf{n}_1$.

Figure 17.72

- It's important to point out again that $\mathbf{n}_1$ is the unit normal that we would use for S_1 alone, independent of S . It is the outward unit normal to S_1 , but it points into D .

► Recall that an inverse square force is proportional to $1/|\mathbf{r}|^2$ multiplied by a unit vector in the radial direction, which is $\mathbf{r}/|\mathbf{r}|$. Combining these two factors gives $\mathbf{F} = \mathbf{r}/|\mathbf{r}|^3$.

- a. Find the net outward flux of $\mathbf{F}$ across the surface of the region $D = \{(x, y, z): a^2 \leq x^2 + y^2 + z^2 \leq b^2\}$ that lies between concentric spheres with radii a and b .
- b. Find the outward flux of $\mathbf{F}$ across any sphere that encloses the origin.

SOLUTION

- a. Although the vector field is undefined at the origin, it is defined and differentiable in D , which excludes the origin. In Section 17.5 (Exercise 73) it was shown that the divergence of the radial field $\mathbf{F} = \frac{\mathbf{r}}{|\mathbf{r}|^p}$ with $p = 3$ is 0. We let S be the union of S_2 , the larger sphere of radius b , and S_1 , the smaller sphere of radius a . Because $\iiint_D \nabla \cdot \mathbf{F} \, dV = 0$, the Divergence Theorem implies that

$$\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = \iint_{S_2} \mathbf{F} \cdot \mathbf{n}_2 \, dS - \iint_{S_1} \mathbf{F} \cdot \mathbf{n}_1 \, dS = 0.$$

Therefore, the net flux across S is zero.

- b. Part (a) implies that

$$\underbrace{\iint_{S_2} \mathbf{F} \cdot \mathbf{n}_2 \, dS}_{\text{out of } D} = \underbrace{\iint_{S_1} \mathbf{F} \cdot \mathbf{n}_1 \, dS}_{\text{into } D}.$$

We see that the flux out of D across S_2 equals the flux into D across S_1 . To find that flux, we evaluate the surface integral over S_1 on which $|\mathbf{r}| = a$. (Because the fluxes are equal, S_2 could also be used.)

The easiest way to evaluate the surface integral is to note that on the sphere S_1 , the unit outward normal vector is $\mathbf{n}_1 = \mathbf{r}/|\mathbf{r}|$. Therefore, the surface integral is

$$\begin{aligned} \iint_{S_1} \mathbf{F} \cdot \mathbf{n}_1 \, dS &= \iint_{S_1} \frac{\mathbf{r}}{|\mathbf{r}|^3} \cdot \frac{\mathbf{r}}{|\mathbf{r}|} \, dS && \text{Substitute for } \mathbf{F} \text{ and } \mathbf{n}_1. \\ &= \iint_{S_1} \frac{|\mathbf{r}|^2}{|\mathbf{r}|^4} \, dS && \mathbf{r} \cdot \mathbf{r} = |\mathbf{r}|^2 \\ &= \iint_{S_1} \frac{1}{a^2} \, dS && |\mathbf{r}| = a \\ &= \frac{4\pi a^2}{a^2} && \text{Surface area} = 4\pi a^2 \\ &= 4\pi. \end{aligned}$$

The same result is obtained using S_2 or any smooth surface enclosing the origin. The flux of the inverse square field across *any* surface enclosing the origin is 4π . As shown in Exercise 46, among radial fields, this property holds only for the inverse square field ($p = 3$).

Related Exercises 26–27 ◀

Gauss' Law

Applying the Divergence Theorem to electric fields leads to one of the fundamental laws of physics. The electric field due to a point charge Q located at the origin is given by the inverse square law,

$$\mathbf{E}(x, y, z) = \frac{Q}{4\pi\epsilon_0} \frac{\mathbf{r}}{|\mathbf{r}|^3},$$

where $\mathbf{r} = \langle x, y, z \rangle$ and ϵ_0 is a physical constant called the *permittivity of free space*.

According to the calculation of Example 4, the flux of the field $\frac{\mathbf{r}}{|\mathbf{r}|^3}$ across any surface that encloses the origin is 4π . Therefore, the flux of the electric field across any surface enclosing the origin is $\frac{Q}{4\pi\epsilon_0} \cdot 4\pi = \frac{Q}{\epsilon_0}$ (Figure 17.73a). This is one statement of Gauss' Law: If S is a surface that encloses a point charge Q , then the flux of the electric field across S is

$$\iint_S \mathbf{E} \cdot \mathbf{n} \, dS = \frac{Q}{\epsilon_0}.$$

Figure 17.73

In fact, Gauss' Law applies to more general charge distributions (Exercise 39). If $q(x, y, z)$ is a charge density (charge per unit volume) defined on a region D enclosed by S , then the total charge within D is $Q = \iiint_D q(x, y, z) \, dV$ (Figure 17.73b). Replacing Q with this triple integral, Gauss' Law takes the form

$$\iint_S \mathbf{E} \cdot \mathbf{n} \, dS = \frac{1}{\epsilon_0} \underbrace{\iiint_D q(x, y, z) \, dV}_Q.$$

Gauss' Law applies to other inverse square fields. In a slightly different form, it also governs heat transfer. If T is the temperature distribution in a solid body D , then the heat flow vector field is $\mathbf{F} = -k\nabla T$. (Heat flows down the temperature gradient.) If $q(x, y, z)$ represents the sources of heat within D , Gauss' Law says

$$\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = -k \iint_S \nabla T \cdot \mathbf{n} \, dS = \iiint_D q(x, y, z) \, dV.$$

We see that, in general, the flux of material (fluid, heat, electric field lines) across the boundary of a region is the cumulative effect of the sources within the region.

A Final Perspective

Table 17.4 offers a look at the progression of fundamental theorems of calculus that have appeared throughout this text. Each theorem builds on its predecessors, extending the same basic idea to a different situation or to higher dimensions.

In all cases, the statement is effectively the same: The cumulative (integrated) effect of the *derivatives* of a function throughout a region is determined by the values of the function on the boundary of that region. This principle underlies much of our understanding of the world around us.

Table 17.4

Fundamental Theorem of Calculus	$\int_a^b f'(x) dx = f(b) - f(a)$	
Fundamental Theorem for Line Integrals	$\int_C \nabla f \cdot d\mathbf{r} = f(B) - f(A)$	
Green's Theorem (Circulation form)	$\iint_R (g_x - f_y) dA = \oint_C f dx + g dy$	
Stokes' Theorem	$\iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} dS = \oint_C \mathbf{F} \cdot d\mathbf{r}$	
Divergence Theorem	$\iiint_D \nabla \cdot \mathbf{F} dV = \iint_S \mathbf{F} \cdot \mathbf{n} dS$	

SECTION 17.8 EXERCISES

Getting Started

1. Explain the meaning of the surface integral in the Divergence Theorem.
2. Interpret the volume integral in the Divergence Theorem.
3. Explain the meaning of the Divergence Theorem.
4. What is the net outward flux of the rotation field $\mathbf{F} = \langle 2z + y, -x, -2x \rangle$ across the surface that encloses any region?
5. What is the net outward flux of the radial field $\mathbf{F} = \langle x, y, z \rangle$ across the sphere of radius 2 centered at the origin?
6. What is the divergence of an inverse square vector field?
7. Suppose $\text{div } \mathbf{F} = 0$ in a region enclosed by two concentric spheres. What is the relationship between the outward fluxes across the two spheres?
8. If $\text{div } \mathbf{F} > 0$ in a region enclosed by a small cube, is the net flux of the field into or out of the cube?

Practice Exercises

9–12. Verifying the Divergence Theorem Evaluate both integrals of the Divergence Theorem for the following vector fields and regions. Check for agreement.

9. $\mathbf{F} = \langle 2x, 3y, 4z \rangle$; $D = \{(x, y, z): x^2 + y^2 + z^2 \leq 4\}$
10. $\mathbf{F} = \langle -x, -y, -z \rangle$;
 $D = \{(x, y, z): |x| \leq 1, |y| \leq 1, |z| \leq 1\}$

11. $\mathbf{F} = \langle z - y, x, -x \rangle$;
 $D = \{(x, y, z): x^2/4 + y^2/8 + z^2/12 \leq 1\}$
12. $\mathbf{F} = \langle x^2, y^2, z^2 \rangle$; $D = \{(x, y, z): |x| \leq 1, |y| \leq 2, |z| \leq 3\}$

13–16. Rotation fields

13. Find the net outward flux of the field $\mathbf{F} = \langle 2z - y, x, -2x \rangle$ across the sphere of radius 1 centered at the origin.
14. Find the net outward flux of the field $\mathbf{F} = \langle z - y, x - z, y - x \rangle$ across the boundary of the cube $\{(x, y, z): |x| \leq 1, |y| \leq 1, |z| \leq 1\}$.
15. Find the net outward flux of the field $\mathbf{F} = \langle bz - cy, cx - az, ay - bx \rangle$ across any smooth closed surface in $\mathbb{R}^3$, where a, b , and c are constants.
16. Find the net outward flux of $\mathbf{F} = \mathbf{a} \times \mathbf{r}$ across any smooth closed surface in $\mathbb{R}^3$, where $\mathbf{a}$ is a constant nonzero vector and $\mathbf{r} = \langle x, y, z \rangle$.

17–24. Computing flux Use the Divergence Theorem to compute the net outward flux of the following fields across the given surface S .

17. $\mathbf{F} = \langle x, -2y, 3z \rangle$; S is the sphere $\{(x, y, z): x^2 + y^2 + z^2 = 6\}$.
18. $\mathbf{F} = \langle x^2, 2xz, y^2 \rangle$; S is the surface of the cube cut from the first octant by the planes $x = 1$, $y = 1$, and $z = 1$.
19. $\mathbf{F} = \langle x, 2y, z \rangle$; S is the boundary of the tetrahedron in the first octant formed by the plane $x + y + z = 1$.
20. $\mathbf{F} = \langle x^2, y^2, z^2 \rangle$; S is the sphere $\{(x, y, z): x^2 + y^2 + z^2 = 25\}$.

21. $\mathbf{F} = \langle y - 2x, x^3 - y, y^2 - z \rangle$; S is the sphere $\{(x, y, z): x^2 + y^2 + z^2 = 4\}$.
22. $\mathbf{F} = \langle y + z, x + z, x + y \rangle$; S consists of the faces of the cube $\{(x, y, z): |x| \leq 1, |y| \leq 1, |z| \leq 1\}$.
23. $\mathbf{F} = \langle x, y, z \rangle$; S is the surface of the paraboloid $z = 4 - x^2 - y^2$, for $z \geq 0$, plus its base in the xy -plane.
24. $\mathbf{F} = \langle x, y, z \rangle$; S is the surface of the cone $z^2 = x^2 + y^2$, for $0 \leq z \leq 4$, plus its top surface in the plane $z = 4$.

25–30. Divergence Theorem for more general regions Use the Divergence Theorem to compute the net outward flux of the following vector fields across the boundary of the given regions D .

25. $\mathbf{F} = \langle z - x, x - y, 2y - z \rangle$; D is the region between the spheres of radius 2 and 4 centered at the origin.
26. $\mathbf{F} = \mathbf{r}|\mathbf{r}| = \langle x, y, z \rangle \sqrt{x^2 + y^2 + z^2}$; D is the region between the spheres of radius 1 and 2 centered at the origin.
27. $\mathbf{F} = \frac{\mathbf{r}}{|\mathbf{r}|} = \frac{\langle x, y, z \rangle}{\sqrt{x^2 + y^2 + z^2}}$; D is the region between the spheres of radius 1 and 2 centered at the origin.
28. $\mathbf{F} = \langle z - y, x - z, 2y - x \rangle$; D is the region between two cubes: $\{(x, y, z): 1 \leq |x| \leq 3, 1 \leq |y| \leq 3, 1 \leq |z| \leq 3\}$.
29. $\mathbf{F} = \langle x^2, -y^2, z^2 \rangle$; D is the region in the first octant between the planes $z = 4 - x - y$ and $z = 2 - x - y$.
30. $\mathbf{F} = \langle x, 2y, 3z \rangle$; D is the region between the cylinders $x^2 + y^2 = 1$ and $x^2 + y^2 = 4$, for $0 \leq z \leq 8$.
31. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.
- If $\nabla \cdot \mathbf{F} = 0$ at all points of a region D , then $\mathbf{F} \cdot \mathbf{n} = 0$ at all points of the boundary of D .
 - If $\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = 0$ on all closed surfaces in $\mathbb{R}^3$, then $\mathbf{F}$ is constant.
 - If $|\mathbf{F}| < 1$, then $\left| \iiint_D \nabla \cdot \mathbf{F} \, dV \right|$ is less than the area of the surface of D .
32. **Flux across a sphere** Consider the radial field $\mathbf{F} = \langle x, y, z \rangle$ and let S be the sphere of radius a centered at the origin. Compute the outward flux of $\mathbf{F}$ across S using the representation $z = \pm \sqrt{a^2 - x^2 - y^2}$ for the sphere (either symmetry or two surfaces must be used).

33–35. Flux integrals Compute the outward flux of the following vector fields across the given surfaces S . You should decide which integral of the Divergence Theorem to use.

33. $\mathbf{F} = \langle x^2 e^y \cos z, -4x e^y \cos z, 2x e^y \sin z \rangle$; S is the boundary of the ellipsoid $x^2/4 + y^2 + z^2 = 1$.
34. $\mathbf{F} = \langle -yz, xz, 1 \rangle$; S is the boundary of the ellipsoid $x^2/4 + y^2/4 + z^2 = 1$.
35. $\mathbf{F} = \langle x \sin y, -\cos y, z \sin y \rangle$; S is the boundary of the region bounded by the planes $x = 1, y = 0, y = \pi/2, z = 0$, and $z = x$.

36. Radial fields Consider the radial vector field

$$\mathbf{F} = \frac{\mathbf{r}}{|\mathbf{r}|^p} = \frac{\langle x, y, z \rangle}{(x^2 + y^2 + z^2)^{p/2}}.$$

Let S be the sphere of radius a centered at the origin.

- Use a surface integral to show that the outward flux of $\mathbf{F}$ across S is $4\pi a^{3-p}$. Recall that the unit normal to the sphere is $\mathbf{r}/|\mathbf{r}|$.
- For what values of p does $\mathbf{F}$ satisfy the conditions of the Divergence Theorem? For these values of p , use the fact (Theorem 17.10) that $\nabla \cdot \mathbf{F} = \frac{3-p}{|\mathbf{r}|^p}$ to compute the flux across S using the Divergence Theorem.

37. Singular radial field Consider the radial field

$$\mathbf{F} = \frac{\mathbf{r}}{|\mathbf{r}|} = \frac{\langle x, y, z \rangle}{(x^2 + y^2 + z^2)^{1/2}}.$$

- Evaluate a surface integral to show that $\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = 4\pi a^2$, where S is the surface of a sphere of radius a centered at the origin.
- Note that the first partial derivatives of the components of $\mathbf{F}$ are undefined at the origin, so the Divergence Theorem does not apply directly. Nevertheless, the flux across the sphere as computed in part (a) is finite. Evaluate the triple integral of the Divergence Theorem as an improper integral as follows. Integrate $\text{div } \mathbf{F}$ over the region between two spheres of radius a and $0 < \varepsilon < a$. Then let $\varepsilon \rightarrow 0^+$ to obtain the flux computed in part (a).

38. Logarithmic potential Consider the potential function

$$\varphi(x, y, z) = \frac{1}{2} \ln(x^2 + y^2 + z^2) = \ln |\mathbf{r}|, \text{ where } \mathbf{r} = \langle x, y, z \rangle.$$

- Show that the gradient field associated with φ is

$$\mathbf{F} = \frac{\mathbf{r}}{|\mathbf{r}|^2} = \frac{\langle x, y, z \rangle}{x^2 + y^2 + z^2}.$$

- Show that $\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = 4\pi a$, where S is the surface of a sphere of radius a centered at the origin.
- Compute $\text{div } \mathbf{F}$.
- Note that $\mathbf{F}$ is undefined at the origin, so the Divergence Theorem does not apply directly. Evaluate the volume integral as described in Exercise 37.

39. Gauss' Law for electric fields The electric field due to a point

charge Q is $\mathbf{E} = \frac{Q}{4\pi\epsilon_0} \frac{\mathbf{r}}{|\mathbf{r}|^3}$, where $\mathbf{r} = \langle x, y, z \rangle$, and ϵ_0 is a constant.

- Show that the flux of the field across a sphere of radius a centered at the origin is $\iint_S \mathbf{E} \cdot \mathbf{n} \, dS = \frac{Q}{\epsilon_0}$.
- Let S be the boundary of the region between two spheres centered at the origin of radius a and b , respectively, with $a < b$. Use the Divergence Theorem to show that the net outward flux across S is zero.
- Suppose there is a distribution of charge within a region D . Let $q(x, y, z)$ be the charge density (charge per unit volume). Interpret the statement that

$$\iiint_D \mathbf{E} \cdot \mathbf{n} \, dS = \frac{1}{\epsilon_0} \iiint_D q(x, y, z) \, dV.$$

- Assuming $\mathbf{E}$ satisfies the conditions of the Divergence Theorem on D , conclude from part (c) that $\nabla \cdot \mathbf{E} = \frac{q}{\epsilon_0}$.
- Because the electric force is conservative, it has a potential function φ . From part (d), conclude that $\nabla^2 \varphi = \nabla \cdot \nabla \varphi = \frac{q}{\epsilon_0}$.

40. Gauss' Law for gravitation The gravitational force due to a point mass M at the origin is proportional to $\mathbf{F} = GM\mathbf{r}/|\mathbf{r}|^3$, where $\mathbf{r} = \langle x, y, z \rangle$ and G is the gravitational constant.

- Show that the flux of the force field across a sphere of radius a centered at the origin is $\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = 4\pi GM$.
- Let S be the boundary of the region between two spheres centered at the origin of radius a and b , respectively, with $a < b$. Use the Divergence Theorem to show that the net outward flux across S is zero.
- Suppose there is a distribution of mass within a region D . Let $\rho(x, y, z)$ be the mass density (mass per unit volume). Interpret the statement that

$$\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = 4\pi G \iiint_D \rho(x, y, z) \, dV.$$

- Assuming $\mathbf{F}$ satisfies the conditions of the Divergence Theorem on D , conclude from part (c) that $\nabla \cdot \mathbf{F} = 4\pi G\rho$.
- Because the gravitational force is conservative, it has a potential function φ . From part (d), conclude that $\nabla^2 \varphi = 4\pi G\rho$.

41–45. Heat transfer Fourier's Law of heat transfer (or heat conduction) states that the heat flow vector $\mathbf{F}$ at a point is proportional to the negative gradient of the temperature; that is, $\mathbf{F} = -k\nabla T$, which means that heat energy flows from hot regions to cold regions. The constant $k > 0$ is called the conductivity, which has metric units of $J/(m \cdot s \cdot K)$. A temperature function for a region D is given. Find the net outward heat flux $\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = -k \iint_S \nabla T \cdot \mathbf{n} \, dS$ across the boundary S of D . In some cases, it may be easier to use the Divergence Theorem and evaluate a triple integral. Assume $k = 1$.

- $T(x, y, z) = 100 + x + 2y + z$;
 $D = \{(x, y, z): 0 \leq x \leq 1, 0 \leq y \leq 1, 0 \leq z \leq 1\}$
- $T(x, y, z) = 100 + x^2 + y^2 + z^2$;
 $D = \{(x, y, z): 0 \leq x \leq 1, 0 \leq y \leq 1, 0 \leq z \leq 1\}$
- $T(x, y, z) = 100 + e^{-z}$;
 $D = \{(x, y, z): 0 \leq x \leq 1, 0 \leq y \leq 1, 0 \leq z \leq 1\}$
- $T(x, y, z) = 100 + x^2 + y^2 + z^2$; D is the unit sphere centered at the origin.
- $T(x, y, z) = 100e^{-x^2 - y^2 - z^2}$; D is the sphere of radius a centered at the origin.

Explorations and Challenges

- 46. Inverse square fields are special** Let $\mathbf{F}$ be a radial field $\mathbf{F} = \mathbf{r}/|\mathbf{r}|^p$, where p is a real number and $\mathbf{r} = \langle x, y, z \rangle$. With $p = 3$, $\mathbf{F}$ is an inverse square field.
- Show that the net flux across a sphere centered at the origin is independent of the radius of the sphere only for $p = 3$.
 - Explain the observation in part (a) by finding the flux of $\mathbf{F} = \mathbf{r}/|\mathbf{r}|^p$ across the boundaries of a spherical box $\{(\rho, \varphi, \theta): a \leq \rho \leq b, \varphi_1 \leq \varphi \leq \varphi_2, \theta_1 \leq \theta \leq \theta_2\}$ for various values of p .
- 47. A beautiful flux integral** Consider the potential function $\varphi(x, y, z) = G(\rho)$, where G is any twice differentiable function and $\rho = \sqrt{x^2 + y^2 + z^2}$; therefore, G depends only on the distance from the origin.

- Show that the gradient vector field associated with φ is

$$\mathbf{F} = \nabla \varphi = G'(\rho) \frac{\mathbf{r}}{\rho}, \text{ where } \mathbf{r} = \langle x, y, z \rangle \text{ and } \rho = |\mathbf{r}|.$$

- Let S be the sphere of radius a centered at the origin and let D be the region enclosed by S . Show that the flux of $\mathbf{F}$ across S is $\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = 4\pi a^2 G'(a)$.
- Show that $\nabla \cdot \mathbf{F} = \nabla \cdot \nabla \varphi = \frac{2G'(\rho)}{\rho} + G''(\rho)$.
- Use part (c) to show that the flux across S (as given in part (b)) is also obtained by the volume integral $\iiint_D \nabla \cdot \mathbf{F} \, dV$. (Hint: Use spherical coordinates and integrate by parts.)

48. Integration by parts (Gauss' Formula) Recall the Product Rule of Theorem 17.13: $\nabla \cdot (u\mathbf{F}) = \nabla u \cdot \mathbf{F} + u(\nabla \cdot \mathbf{F})$.

- Integrate both sides of this identity over a solid region D with a closed boundary S , and use the Divergence Theorem to prove an integration by parts rule:

$$\iiint_D u(\nabla \cdot \mathbf{F}) \, dV = \iint_S u\mathbf{F} \cdot \mathbf{n} \, dS - \iiint_D \nabla u \cdot \mathbf{F} \, dV.$$

- Explain the correspondence between this rule and the integration by parts rule for single-variable functions.
- Use integration by parts to evaluate $\iiint_D (x^2y + y^2z + z^2x) \, dV$, where D is the cube in the first octant cut by the planes $x = 1$, $y = 1$, and $z = 1$.

49. Green's Formula Write Gauss' Formula of Exercise 48 in two dimensions—that is, where $\mathbf{F} = \langle f, g \rangle$, D is a plane region R and C is the boundary of R . Show that the result is Green's Formula:

$$\iint_R u(f_x + g_y) \, dA = \oint_C u(\mathbf{F} \cdot \mathbf{n}) \, ds - \iint_R (fu_x + gu_y) \, dA.$$

Show that with $u = 1$, one form of Green's Theorem appears. Which form of Green's Theorem is it?

50. Green's First Identity Prove Green's First Identity for twice differentiable scalar-valued functions u and v defined on a region D :

$$\iiint_D (u\nabla^2 v + \nabla u \cdot \nabla v) \, dV = \iint_S u\nabla v \cdot \mathbf{n} \, dS,$$

where $\nabla^2 v = \nabla \cdot \nabla v$. You may apply Gauss' Formula in Exercise 48 to $\mathbf{F} = \nabla v$ or apply the Divergence Theorem to $\mathbf{F} = u\nabla v$.

51. Green's Second Identity Prove Green's Second Identity for scalar-valued functions u and v defined on a region D :

$$\iiint_D (u\nabla^2 v - v\nabla^2 u) \, dV = \iint_S (u\nabla v - v\nabla u) \cdot \mathbf{n} \, dS.$$

(Hint: Reverse the roles of u and v in Green's First Identity.)

52–54. Harmonic functions A scalar-valued function φ is harmonic on a region D if $\nabla^2 \varphi = \nabla \cdot \nabla \varphi = 0$ at all points of D .

- Show that the potential function $\varphi(x, y, z) = |\mathbf{r}|^{-p}$ is harmonic provided $p = 0$ or $p = 1$, where $\mathbf{r} = \langle x, y, z \rangle$. To what vector fields do these potentials correspond?
 - Show that if φ is harmonic on a region D enclosed by a surface S , then $\iint_S \nabla \varphi \cdot \mathbf{n} \, dS = 0$.
 - Show that if u is harmonic on a region D enclosed by a surface S , then $\iint_S u\nabla u \cdot \mathbf{n} \, dS = \iiint_D |\nabla u|^2 \, dV$.
- 55. Miscellaneous integral identities** Prove the following identities.
- $\iiint_D \nabla \times \mathbf{F} \, dV = \iint_S (\mathbf{n} \times \mathbf{F}) \, dS$ (Hint: Apply the Divergence Theorem to each component of the identity.)
 - $\iint_S (\mathbf{n} \times \nabla \varphi) \, dS = \oint_C \varphi \, d\mathbf{r}$ (Hint: Apply Stokes' Theorem to each component of the identity.)

QUICK CHECK ANSWERS

1. If $\mathbf{F}$ is constant, then $\operatorname{div} \mathbf{F} = 0$, so $\iiint_D \nabla \cdot \mathbf{F} \, dV = \iint_S \mathbf{F} \cdot \mathbf{n} \, dS = 0$. This means that all the “material” that flows into one side of D flows out of the other side of D .
 2. The vector field and the divergence are positive throughout D .
 3. The vector field has no flow into or out of the

cube on the faces $x = 0$, $y = 0$, and $z = 0$ because the vectors of $\mathbf{F}$ on these faces are parallel to the faces. The vector field points out of the cube on the $x = 1$ and $z = 1$ faces and into the cube on the $y = 1$ face. $\operatorname{div} \mathbf{F} = 2$, so there is a net flow out of the cube. ◀

CHAPTER 17 REVIEW EXERCISES

1. **Explain why or why not** Determine whether the following statements are true and give an explanation or counterexample.
- The rotation field $\mathbf{F} = \langle -y, x \rangle$ has zero curl and zero divergence.
 - $\nabla \times \nabla \phi = \mathbf{0}$
 - Two vector fields with the same curl differ by a constant vector field.
 - Two vector fields with the same divergence differ by a constant vector field.
 - If $\mathbf{F} = \langle x, y, z \rangle$ and S encloses a region D , then $\iint_S \mathbf{F} \cdot \mathbf{n} \, dS$ is three times the volume of D .
2. **Matching vector fields** Match vector fields a–f with the graphs A–F. Let $\mathbf{r} = \langle x, y \rangle$.
- $\mathbf{F} = \langle x, y \rangle$
 - $\mathbf{F} = \langle -2y, 2x \rangle$
 - $\mathbf{F} = \mathbf{r}/|\mathbf{r}|$
 - $\mathbf{F} = \langle y - x, x \rangle$
 - $\mathbf{F} = \langle e^{-y}, e^{-x} \rangle$
 - $\mathbf{F} = \langle \sin \pi x, \sin \pi y \rangle$

(A)

(B)

(C)

(D)

(E)

(F)

3–4. Gradient fields in $\mathbb{R}^2$ Find the vector field $\mathbf{F} = \nabla \phi$ for the following potential functions. Sketch a few level curves of ϕ and a few vectors of $\mathbf{F}$ along the level curves.

- $\phi(x, y) = x^2 + 4y^2$, for $|x| \leq 5$, $|y| \leq 5$
- $\phi(x, y) = (x^2 - y^2)/2$, for $|x| \leq 2$, $|y| \leq 2$

5–6. Gradient fields in $\mathbb{R}^3$ Find the vector field $\mathbf{F} = \nabla \phi$ for the following potential functions.

- $\phi(x, y, z) = 1/|\mathbf{r}|$, where $\mathbf{r} = \langle x, y, z \rangle$
- $\phi(x, y, z) = \frac{1}{2}e^{-x^2 - y^2 - z^2}$

7. Normal component Let C be the circle of radius 2 centered at the origin with counterclockwise orientation. Give the unit outward normal vector at any point (x, y) on C .

8–10. Line integrals Evaluate the following line integrals.

- $\int_C (x^2 - 2xy + y^2) \, ds$; C is the upper half of a circle $\mathbf{r}(t) = \langle 5 \cos t, 5 \sin t \rangle$, for $0 \leq t \leq \pi$.
- $\int_C ye^{-xz} \, ds$; C is the path $\mathbf{r}(t) = \langle 2t, 3t, -6t \rangle$, for $0 \leq t \leq 2$.
- $\int_C (xz - y^2) \, ds$; C is the line segment from $(0, 1, 2)$ to $(-3, 7, -1)$.
- Two parameterizations** Verify that $\oint_C (x - 2y + 3z) \, ds$ has the same value when C is given by $\mathbf{r}(t) = \langle 2 \cos t, 2 \sin t, 0 \rangle$, for $0 \leq t \leq 2\pi$, and by $\mathbf{r}(t) = \langle 2 \cos t^2, 2 \sin t^2, 0 \rangle$, for $0 \leq t \leq \sqrt{2\pi}$.
- Work integral** Find the work done in moving an object from $P(1, 0, 0)$ to $Q(0, 1, 0)$ in the presence of the force $\mathbf{F} = \langle 1, 2y, -4z \rangle$ along the following paths.
 - The line segment from P to Q
 - The line segment from P to $O(0, 0, 0)$ followed by the line segment from O to Q
 - The arc of the quarter circle from P to Q
 - Is the work independent of the path?

13–14. Work integrals in $\mathbb{R}^3$ Given the force field $\mathbf{F}$, find the work required to move an object on the given curve.

- $\mathbf{F} = \langle -y, z, x \rangle$ on the path consisting of the line segment from $(0, 0, 0)$ to $(0, 1, 0)$ followed by the line segment from $(0, 1, 0)$ to $(0, 1, 4)$
- $\mathbf{F} = \frac{\langle x, y, z \rangle}{(x^2 + y^2 + z^2)^{3/2}}$ on the path $\mathbf{r}(t) = \langle t^2, 3t^2, -t^2 \rangle$, for $1 \leq t \leq 2$

15–18. Circulation and flux Find the circulation and the outward flux of the following vector fields for the curve $\mathbf{r}(t) = \langle 2 \cos t, 2 \sin t \rangle$, for $0 \leq t \leq 2\pi$.

15. $\mathbf{F} = \langle y - x, y \rangle$

16. $\mathbf{F} = \langle x, y \rangle$

17. $\mathbf{F} = \mathbf{r}/|\mathbf{r}|^2$, where $\mathbf{r} = \langle x, y \rangle$

18. $\mathbf{F} = \langle x - y, x \rangle$

19. Flux in channel flow Consider the flow of water in a channel whose boundaries are the planes $y = \pm L$ and $z = \pm 1/2$. The velocity field in the channel is $\mathbf{v} = \langle v_0(L^2 - y^2), 0, 0 \rangle$. Find the flux across the cross section of the channel at $x = 0$ in terms of v_0 and L .

20–23. Conservative vector fields and potentials Determine whether the following vector fields are conservative on their domains. If so, find a potential function.

20. $\mathbf{F} = \langle y^2, 2xy \rangle$

21. $\mathbf{F} = \langle y, x + z^2, 2yz \rangle$

22. $\mathbf{F} = \langle e^x \cos y, -e^x \sin y \rangle$

23. $\mathbf{F} = e^z \langle y, x, xy \rangle$

24–27. Evaluating line integrals Evaluate the line integral $\int_C \mathbf{F} \cdot d\mathbf{r}$ for the following vector fields $\mathbf{F}$ and curves C in two ways.

a. By parameterizing C

b. By using the Fundamental Theorem for line integrals, if possible

24. $\mathbf{F} = \nabla(x^2y)$; $C: \mathbf{r}(t) = \langle 9 - t^2, t \rangle$, for $0 \leq t \leq 3$

25. $\mathbf{F} = \nabla(xy z)$; $C: \mathbf{r}(t) = \langle \cos t, \sin t, t/\pi \rangle$, for $0 \leq t \leq \pi$

26. $\mathbf{F} = \langle x, -y \rangle$; C is the square with vertices $(\pm 1, \pm 1)$ with counterclockwise orientation.

27. $\mathbf{F} = \langle y, z, -x \rangle$; $C: \mathbf{r}(t) = \langle \cos t, \sin t, 4 \rangle$, for $0 \leq t \leq 2\pi$

28. Radial fields in $\mathbb{R}^2$ are conservative Prove that the radial field $\mathbf{F} = \mathbf{r}/|\mathbf{r}|^p$, where $\mathbf{r} = \langle x, y \rangle$ and p is a real number, is conservative on $\mathbb{R}^2$ with the origin removed. For what value of p is $\mathbf{F}$ conservative on $\mathbb{R}^2$ (including the origin)?

29–32. Green's Theorem for line integrals Use either form of Green's Theorem to evaluate the following line integrals.

29. $\oint_C xy^2 dx + x^2y dy$; C is the triangle with vertices $(0, 0)$, $(2, 0)$, and $(0, 2)$ with counterclockwise orientation.

30. $\oint_C (-3y + x^{3/2}) dx + (x - y^{2/3}) dy$; C is the boundary of the half-disk $\{(x, y): x^2 + y^2 \leq 2, y \geq 0\}$ with counterclockwise orientation.

31. $\oint_C (x^3 + xy) dy + (2y^2 - 2x^2y) dx$; C is the square with vertices $(\pm 1, \pm 1)$ with counterclockwise orientation.

32. $\oint_C 3x^3 dy - 3y^3 dx$; C is the circle of radius 4 centered at the origin with clockwise orientation.

33–34. Areas of plane regions Find the area of the following regions using a line integral.

33. The region enclosed by the ellipse $x^2 + 4y^2 = 16$

34. The region bounded by the hypocycloid $\mathbf{r}(t) = \langle \cos^3 t, \sin^3 t \rangle$, for $0 \leq t \leq 2\pi$

35–36. Circulation and flux Consider the following vector fields.

a. Compute the circulation on the boundary of the region R (with counterclockwise orientation).

b. Compute the outward flux across the boundary of R .

35. $\mathbf{F} = \mathbf{r}/|\mathbf{r}|$, where $\mathbf{r} = \langle x, y \rangle$ and R is the half-annulus $\{(r, \theta): 1 \leq r \leq 3, 0 \leq \theta \leq \pi\}$

36. $\mathbf{F} = \langle -\sin y, x \cos y \rangle$, where R is the square $\{(x, y): 0 \leq x \leq \pi/2, 0 \leq y \leq \pi/2\}$

37. Parameters Let $\mathbf{F} = \langle ax + by, cx + dy \rangle$, where a, b, c , and d are constants.

a. For what values of a, b, c , and d is $\mathbf{F}$ conservative?

b. For what values of a, b, c , and d is $\mathbf{F}$ source free?

c. For what values of a, b, c , and d is $\mathbf{F}$ conservative and source free?

38–41. Divergence and curl Compute the divergence and curl of the following vector fields. State whether the field is source free or irrotational.

38. $\mathbf{F} = \langle yz, xz, xy \rangle$

39. $\mathbf{F} = \mathbf{r}/|\mathbf{r}| = \langle x, y, z \rangle / \sqrt{x^2 + y^2 + z^2}$

40. $\mathbf{F} = \langle \sin xy, \cos yz, \sin xz \rangle$

41. $\mathbf{F} = \langle 2xy + z^4, x^2, 4xz^3 \rangle$

42. **Identities** Prove that $\nabla \cdot \left(\frac{1}{|\mathbf{r}|^4} \right) = -\frac{4\mathbf{r}}{|\mathbf{r}|^6}$ and use the result to prove that $\nabla \cdot \left(\frac{1}{|\mathbf{r}|^4} \right) = \frac{12}{|\mathbf{r}|^6}$.

43. Maximum curl Let $\mathbf{F} = \langle z, x, -y \rangle$.

a. What is the scalar component of $\text{curl } \mathbf{F}$ in the direction of $\mathbf{n} = \langle 1, 0, 0 \rangle$?

b. What is the scalar component of $\text{curl } \mathbf{F}$ in the direction of $\mathbf{n} = \langle 0, -1/\sqrt{2}, 1/\sqrt{2} \rangle$?

c. In the direction of what unit vector $\mathbf{n}$ is the scalar component of $\text{curl } \mathbf{F}$ a maximum?

44. Paddle wheel in a vector field Let $\mathbf{F} = \langle 0, 2x, 0 \rangle$ and let $\mathbf{n}$ be a unit vector aligned with the axis of a paddle wheel located on the y -axis.

a. If the axis of the paddle wheel is aligned with $\mathbf{n} = \langle 1, 0, 0 \rangle$, how fast does it spin?

b. If the axis of the paddle wheel is aligned with $\mathbf{n} = \langle 0, 0, 1 \rangle$, how fast does it spin?

c. For what direction $\mathbf{n}$ does the paddle wheel spin fastest?

45–48. Surface areas Use a surface integral to find the area of the following surfaces.

45. The hemisphere $x^2 + y^2 + z^2 = 9$, for $z \geq 0$

46. The frustum of the cone $z^2 = x^2 + y^2$, for $2 \leq z \leq 4$ (excluding the bases)

47. The plane $z = 6 - x - y$ above the square $|x| \leq 1, |y| \leq 1$

48. The surface $f(x, y) = \sqrt{2}xy$ above the polar region $\{(r, \theta): 0 \leq r \leq 2, 0 \leq \theta \leq 2\pi\}$

49–51. Surface integrals Evaluate the following surface integrals.

49. $\iint_S (1 + yz) dS$; S is the plane $x + y + z = 2$ in the first octant.

50. $\iint_S \langle 0, y, z \rangle \cdot \mathbf{n} \, dS$; S is the curved surface of the cylinder $y^2 + z^2 = a^2$, for $|x| \leq 8$, with outward normal vectors.
51. $\iint_S (x - y + z) \, dS$; S is the entire surface, including the base, of the hemisphere $x^2 + y^2 + z^2 = 4$, for $z \geq 0$.

52–53. Flux integrals Find the flux of the following vector fields across the given surface. Assume the vectors normal to the surface point outward.

52. $\mathbf{F} = \langle x, y, z \rangle$ across the curved surface of the cylinder $x^2 + y^2 = 1$, for $|z| \leq 8$
53. $\mathbf{F} = \mathbf{r}/|\mathbf{r}|$ across the sphere of radius a centered at the origin, where $\mathbf{r} = \langle x, y, z \rangle$
54. **Three methods** Find the surface area of the paraboloid $z = x^2 + y^2$, for $0 \leq z \leq 4$, in three ways.
- Use an explicit description of the surface.
 - Use the parametric description $\mathbf{r} = \langle v \cos u, v \sin u, v^2 \rangle$.
 - Use the parametric description $\mathbf{r} = \langle \sqrt{v} \cos u, \sqrt{v} \sin u, v \rangle$.
55. **Flux across hemispheres and paraboloids** Let S be the hemisphere $x^2 + y^2 + z^2 = a^2$, for $z \geq 0$, and let T be the paraboloid $z = a - (x^2 + y^2)/a$, for $z \geq 0$, where $a > 0$. Assume the surfaces have outward normal vectors.
- Verify that S and T have the same base ($x^2 + y^2 \leq a^2$) and the same high point $(0, 0, a)$.
 - Which surface has the greater area?
 - Show that the flux of the radial field $\mathbf{F} = \langle x, y, z \rangle$ across S is $2\pi a^3$.
 - Show that the flux of the radial field $\mathbf{F} = \langle x, y, z \rangle$ across T is $3\pi a^3/2$.

56. **Surface area of an ellipsoid** Consider the ellipsoid $x^2/a^2 + y^2/b^2 + z^2/c^2 = 1$, where a, b , and c are positive real numbers.
- Show that the surface is described by the parametric equations

$$\mathbf{r}(u, v) = \langle a \cos u \sin v, b \sin u \sin v, c \cos v \rangle,$$
 for $0 \leq u \leq 2\pi, 0 \leq v \leq \pi$.
 - Write an integral for the surface area of the ellipsoid.

57–58. Stokes' Theorem for line integrals Evaluate the line integral $\oint_C \mathbf{F} \cdot d\mathbf{r}$ using Stokes' Theorem. Assume C has counterclockwise orientation.

57. $\mathbf{F} = \langle xz, yz, xy \rangle$; C is the circle $x^2 + y^2 = 4$ in the xy -plane.
58. $\mathbf{F} = \langle x^2 - y^2, x, 2yz \rangle$; C is the boundary of the plane $z = 6 - 2x - y$ in the first octant.

59–60. Stokes' Theorem for surface integrals Use Stokes' Theorem to evaluate the surface integral $\iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS$. Assume $\mathbf{n}$ is the outward normal.

59. $\mathbf{F} = \langle -z, x, y \rangle$, where S is the hyperboloid $z = 10 - \sqrt{1 + x^2 + y^2}$, for $z \geq 0$
60. $\mathbf{F} = \langle x^2 - z^2, y^2, xz \rangle$, where S is the hemisphere $x^2 + y^2 + z^2 = 4$, for $y \geq 0$
61. **Conservative fields** Use Stokes' Theorem to find the circulation of the vector field $\mathbf{F} = \nabla(10 - x^2 + y^2 + z^2)$ around any smooth closed curve C with counterclockwise orientation.
- 62–64. Computing fluxes** Use the Divergence Theorem to compute the outward flux of the following vector fields across the given surfaces S .
62. $\mathbf{F} = \langle -x, x - y, x - z \rangle$; S is the surface of the cube cut from the first octant by the planes $x = 1, y = 1$, and $z = 1$.
63. $\mathbf{F} = \langle x^3, y^3, z^3 \rangle/3$; S is the sphere $\{(x, y, z): x^2 + y^2 + z^2 = 9\}$.
64. $\mathbf{F} = \langle x^2, y^2, z^2 \rangle$; S is the cylinder $\{(x, y, z): x^2 + y^2 = 4, 0 \leq z \leq 8\}$.

65–66. General regions Use the Divergence Theorem to compute the outward flux of the following vector fields across the boundary of the given regions D .

65. $\mathbf{F} = \langle x^3, y^3, 10 \rangle$; D is the region between the hemispheres of radius 1 and 2 centered at the origin with bases in the xy -plane.
66. $\mathbf{F} = \frac{\mathbf{r}}{|\mathbf{r}|^3} = \frac{\langle x, y, z \rangle}{(x^2 + y^2 + z^2)^{3/2}}$; D is the region between two spheres with radii 1 and 2 centered at $(5, 5, 5)$.
67. **Flux integrals** Compute the outward flux of the field $\mathbf{F} = \langle x^2 + x \sin y, y^2 + 2 \cos y, z^2 + z \sin y \rangle$ across the surface S that is the boundary of the prism bounded by the planes $y = 1 - x, x = 0, y = 0, z = 0$, and $z = 4$.
68. **Stokes' Theorem on a compound surface** Consider the surface S consisting of the quarter-sphere $x^2 + y^2 + z^2 = a^2$, for $z \geq 0$ and $x \geq 0$, and the half-disk in the yz -plane $y^2 + z^2 \leq a^2$, for $z \geq 0$. The boundary of S in the xy -plane is C , which consists of the semicircle $x^2 + y^2 = a^2$, for $x \geq 0$, and the line segment $[-a, a]$ on the y -axis, with a counterclockwise orientation. Let $\mathbf{F} = \langle 2z - y, x - z, y - 2x \rangle$.
- Describe the direction in which the normal vectors point on S .
 - Evaluate $\oint_C \mathbf{F} \cdot d\mathbf{r}$
 - Evaluate $\iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, dS$ and check for agreement with part (b).

Chapter 17 Guided Projects

Applications of the material in this chapter and related topics can be found in the following Guided Projects. For additional information, see the Preface.

- Ideal fluid flow
- Maxwell's equations
- Planimeters and vector fields
- Vector calculus in other coordinate systems

Second-Order Differential Equations

- D2.1 Basic Ideas
- D2.2 Linear Homogeneous Equations
- D2.3 Linear Nonhomogeneous Equations
- D2.4 Applications
- D2.5 Complex Forcing Functions

Chapter Preview Previously we introduced first-order differential equations and illustrated their use in describing how physical and biological systems change in time or space. As you will see in this chapter, second-order differential equations are equally applicable and are widely used for similar purposes in many disciplines. After presenting some fundamental concepts that underlie second-order linear equations, we turn to linear constant-coefficient equations, which happen to be among the most applicable of all differential equations. After learning how to solve these equations and their associated initial value problems, we discuss a few of the many mathematical models based on second-order equations. The chapter closes with a look at transfer functions, which are used to analyze and design mechanical and electrical oscillators.

D2.1 Basic Ideas

Much of what you learned about first-order differential equations previously will be useful in the study of second-order equations. Once again, you will see the idea of a *general solution*, which is an entire family of functions that satisfy the equation. However, many of the methods used to find general solutions of first-order equations do not work for second-order equations. As a result, much of the chapter is devoted to developing new solution methods. At the same time, we highlight many applications of second-order equations.

A Quick Overview

Perhaps the most common source of second-order differential equations is Newton's second law of motion, which governs the motion of everyday objects (for example, planets, billiard balls, and raindrops). Therefore, much of this chapter is devoted to developing mathematical formulations of *systems* that are in motion or that have time-dependent behavior. As you will see, a *system* may be a moving object such as a falling stone, a swinging pendulum, or a mass on a spring. Less obvious, a system may also be an electrical circuit that produces a radio signal, a boat in pursuit of a fleeing target, or the organs of a person assimilating a drug.

Here is an example of a system. Imagine a block of mass m hanging at rest from a solid support by a spring. If the block is displaced from its rest position and released, then it oscillates up and down along a line (Figure D2.1). We let $y(t)$ be the position of the block relative to its rest position t time units after it is released. When the spring is stretched below the rest position, the position of the block $y(t)$ is positive.

FIGURE D2.1

► The term $my''(t)$ is called the *inertial term* because if there are no external forces ($F = 0$), then the equation becomes $my''(t) = 0$, which implies that y' (the velocity) is constant. In this case, the object maintains its initial velocity at all times due to its inertia.

Newton's second law for one-dimensional motion governs the motion of the block; it says that

$$\underbrace{\text{mass}}_m \cdot \underbrace{\text{acceleration}}_{a = y''} = \underbrace{\text{sum of forces}}_F.$$

We know that the acceleration is $a(t) = y''(t)$. Therefore, Newton's second law takes the form

$$\underbrace{my''(t)}_{\substack{\text{Inertial} \\ \text{term}}} = \underbrace{F}_{\substack{\text{Sum of} \\ \text{forces}}},$$

where the forces included in F (such as the restoring force of the spring, air resistance, and external forces) may depend on the time t , the position y , and the velocity y' .

We will investigate the spring-block system in detail in Section D2.4. As you will see, a complete mathematical formulation of this system includes a differential equation, with all the relevant external forces, *plus* a set of initial conditions. The initial conditions specify the initial position and velocity of the block. A typical set of initial conditions has the form $y(0) = A$, $y'(0) = B$, where A and B are given constants.

This combination of a differential equation plus initial conditions is called an **initial value problem**. The goal of this chapter is to learn how to solve second-order initial value problems.

Terminology

Recall that the **order** of a differential equation is the highest order that appears on a derivative in the equation. This chapter deals with **linear** second-order equations of the form

$$y''(t) + p(t)y'(t) + q(t)y(t) = f(t). \quad (1)$$

In this equation, p , q , and f are specified functions of t that are continuous on some interval of interest that we call I . The equation is linear because the unknown function y and its derivatives appear only to the first power, and not in products with each other, or as arguments of other functions. Equations that cannot be put in this form are **nonlinear**. Solving equation (1) means finding a function y that satisfies the equation on the interval I .

Another useful distinction concerns the function f on the right side of equation (1). An equation in which $f(t) = 0$ on the interval of interest is said to be **homogeneous**. An equation in which f is not identically zero is **nonhomogeneous**.

EXAMPLE 1 Classifying differential equations Classify the following differential equations that arise from Newton's second law.

► When there is no risk of confusion, it is common practice to suppress the independent variable and write y'' , y' , and y instead of $y''(t)$, $y'(t)$, and $y(t)$, respectively.

- $my'' = -0.001y' - 2.1y$ (This equation describes a block of mass m oscillating on a spring in the presence of friction.)
- $my'' = mg - 0.05(y')^2$ (This equation describes an object of mass m falling in a gravitational field subject to air resistance, where g is the acceleration due to gravity.)

SOLUTION

- Writing the equation in the form $y'' + (0.001/m)y' + (2.1/m)y = 0$, we see that it has the form given in (1). The term with the highest order derivative is y'' ; therefore, the equation is second order. It is linear because y and its derivatives appear only to the first power, and they do not appear in products or composed with other functions. It is a homogeneous equation because there is no term independent of y and its derivatives.

- b. As in part (a), the equation is second order. It is nonlinear because y' appears to the second power, and it is nonhomogeneous because the term mg is independent of y and its derivatives.

Related Exercises 9–12 ◀

QUICK CHECK 1 Classify these equations with respect to order, linearity, and homogeneity. A: $y' + 3y = 4t^2$, B: $y'' - 4y' + 2y = 0$. ◀

Homogeneous Equations and General Solutions

We now turn to second-order linear homogeneous equations of the form

$$y'' + py' + qy = 0,$$

and see what it means for a function to be a solution of such an equation.

EXAMPLE 2 Verifying solutions Consider the linear differential equation

$$t^2 y'' - ty' - 3y = 0, \quad \text{for } t > 0.$$

► Some books refer to solutions of the homogeneous equation as *complementary solutions* or *complementary functions*.

► The equation in Example 2 is linear. It can be put in the form $y'' + py' + qy = 0$ by dividing the equation by t^2 , where $t > 0$.

- a. Verify by substitution that the functions $y = t^3$ and $y = \frac{1}{t}$ are solutions of the equation.
- b. Verify by substitution that the function $y = 100t^3$ is a solution of the equation.
- c. Verify by substitution that the function $y = 6t^3 + \frac{8}{t}$ is a solution of the equation.

SOLUTION

- a. Substituting $y = t^3$ into the equation, we carry out the following calculations.

$$\begin{aligned} t^2(t^3)'' - t(t^3)' - 3(t^3) \\ \underbrace{y'' = 6t} \quad \underbrace{y' = 3t^2} \quad \underbrace{y = t^3} \\ = t^2(6t) - t(3t^2) - 3t^3 \\ = t^3(6 - 3 - 3) \\ = 0 \end{aligned}$$

We see that $y = t^3$ satisfies the equation, for all $t > 0$. Substituting $y = t^{-1}$ into the equation, we find that

$$\begin{aligned} t^2(t^{-1})'' - t(t^{-1})' - 3(t^{-1}) \\ \underbrace{y'' = 2t^{-3}} \quad \underbrace{y' = -t^{-2}} \quad \underbrace{y = t^{-1}} \\ = t^2(2t^{-3}) + t(t^{-2}) - 3t^{-1} \\ = t^{-1}(2 + 1 - 3) \\ = 0. \end{aligned}$$

The function $y(t) = t^{-1}$ also satisfies the equation, for all $t > 0$.

- b. Recall that $(cy(t))' = cy'(t)$ for real numbers c . So you might anticipate that multiplying the solution $y(t) = t^3$ by the constant 100 will produce another solution. A quick check shows that

$$\begin{aligned} t^2(100t^3)'' - t(100t^3)' - 3(100t^3) &= 100t^3(6 - 3 - 3) = 0. \\ \underbrace{y'' = 600t} \quad \underbrace{y' = 300t^2} \quad \underbrace{y = 100t^3} \end{aligned}$$

The function $y = 100t^3$ is a solution. We could replace 100 by any constant c and the function $y = ct^3$ would also be a solution. Similarly, $y = ct^{-1}$ is a solution, for any constant c .

- c. By parts (a) and (b), we know that $y = t^3$ and $y = t^{-1}$ are both solutions of the equation. Now we investigate whether a constant multiplied by one solution plus a constant multiplied by the other solution is also a solution. Substituting, we have

$$\begin{aligned} & t^2(6t^3 + 8t^{-1})'' - t(6t^3 + 8t^{-1})' - 3(6t^3 + 8t^{-1}) \\ & \quad \underbrace{y'' = 36t + 16t^{-3}} \quad \underbrace{y' = 18t^2 - 8t^{-2}} \quad \underbrace{y = 6t^3 + 8t^{-1}} \\ & = t^3(36 - 18 - 18) + t^{-1}(16 + 8 - 24) \\ & = 0. \end{aligned}$$

In this case, the sum of constant multiples of two solutions is also a solution, for any constants. Related Exercises 13–22 ◀

► Notice that zero function $y = 0$ is always a solution of a homogeneous equation. So when we refer to solutions of homogeneous equations, we always mean nonzero (often called *nontrivial*) solutions.

Example 2 raises some fundamental questions about linear differential equations and it gives some hints about answers. How many solutions does a second-order linear equation have? When can you multiply a solution by a constant (as in Example 2b) and produce another solution? When can you add two solutions (as in Example 2c) and get another solution? Focusing on homogeneous equations, the following theorem begins to answer these questions.

THEOREM D2.1 Superposition Principle

Suppose that y_1 and y_2 are solutions of the homogeneous second-order linear equation $y'' + py' + qy = 0$. Then the function $y = c_1y_1 + c_2y_2$ is also a solution of the homogeneous equation, where c_1 and c_2 are arbitrary constants.

Proof: We verify by substitution that the function $y = c_1y_1 + c_2y_2$ satisfies the equation.

$$\begin{aligned} & (c_1y_1 + c_2y_2)'' + p(c_1y_1 + c_2y_2)' + q(c_1y_1 + c_2y_2) \\ & = c_1y_1'' + c_1py_1' + qc_1y_1 + c_2y_2'' + pc_2y_2' + qc_2y_2 && \text{Expand derivatives; regroup terms.} \\ & = c_1(\underbrace{y_1'' + py_1' + qy_1}_{\substack{\text{equals 0;} \\ y_1 \text{ is a solution}}}) + c_2(\underbrace{y_2'' + py_2' + qy_2}_{\substack{\text{equals 0;} \\ y_2 \text{ is a solution}}}) && \text{Factor } c_1 \text{ and } c_2. \\ & = c_1 \cdot 0 + c_2 \cdot 0 && y_1 \text{ and } y_2 \text{ are solutions.} \\ & = 0 \end{aligned}$$

We have confirmed that $y = c_1y_1 + c_2y_2$ is a solution of the homogeneous equation when y_1 and y_2 are solutions. ▶

A function of the form $c_1y_1 + c_2y_2$ is called a **linear combination** or **superposition** of y_1 and y_2 . Theorem D2.1 says that linear combinations of solutions of a linear homogeneous equation are also solutions. This important property applies only to linear differential equations.

We now turn to the question of whether a linear combination such as $c_1y_1 + c_2y_2$ accounts for *all* the solutions of a homogeneous equation. The following definition is critical.

DEFINITION Linear Dependence/Independence of Two Functions

Two functions $\{f_1(t), f_2(t)\}$ are **linearly dependent** on an interval I if one function is a nonzero constant multiple of the other function, for all t in I ; that is, for some nonzero constant c , $f_1(t) = cf_2(t)$, for all t in I . Otherwise, $\{f_1(t), f_2(t)\}$ are **linearly independent** on I .

For example, the functions $\{t, t^3\}$ are linearly independent on any interval because there is no constant c such that $t = ct^3$, for all t in that interval (Figure D2.2a). Similarly, the functions $\{\sin t, \cos t\}$ are linearly independent on any interval, whereas the functions $\{e^t, 2e^t\}$ are constant multiples of each other and are linearly dependent on any interval (Figure D2.2b).

FIGURE D2.2

Using the same argument, the following pairs of functions are linearly independent:

$$\{\sin at, \cos bt\} \text{ on } (-\infty, \infty), \text{ for real numbers } a \neq 0 \text{ and } b,$$

$$\{e^{at}, e^{bt}\} \text{ on } (-\infty, \infty), \text{ for real numbers } a \neq b,$$

$$\{t^p, t^q\} \text{ on } (0, \infty), \text{ for real numbers } p \neq q.$$

An Aside The concept of linear independence is important in many areas of mathematics and it applies to objects other than functions. More formally, a set of n functions $\{f_1(t), f_2(t), \dots, f_n(t)\}$ is *linearly dependent* on an interval I if there are constants $c_1, c_2, \dots, c_n$, *not all zero*, such that

$$c_1 f_1(t) + c_2 f_2(t) + \dots + c_n f_n(t) = 0, \quad \text{for all } t \text{ in } I.$$

Equivalently, if one function in the set can be written as a linear combination of the other functions, then the functions are linearly dependent. If this identity holds only by taking $c_1 = c_2 = \dots = c_n = 0$, then the functions are *linearly independent*. For example, the functions $\{1, t, t^2\}$ are linearly independent, whereas the functions $\{t, t^2, 3t^2 - 2t\}$ are linearly dependent on $(-\infty, \infty)$. When $n = 2$, this more general definition reduces to the definition given above.

QUICK CHECK 2 Are the following pairs of functions linearly independent or linearly dependent on any interval $[a, b]$? $\{1, \sin t\}$, $\{t^5, -t^5\}$, $\{e^{2t}, -e^{-2t}\}$, $\{\sin^2 t, \cos^2 t\}$ ◀

As stated in the following theorem, linear independence is the key to determining whether we have found all the solutions of a linear homogeneous differential equation.

► The proof of Theorem D2.2 is usually given in more advanced courses on differential equations. That proof relies on the existence and uniqueness theorem for initial value problems given at the end of this section.

THEOREM D2.2

If p and q are continuous on an interval I , and y_1 and y_2 are linearly independent solutions of the linear homogeneous equation $y'' + py' + qy = 0$, then all solutions of the homogeneous equation can be expressed as a linear combination $y = c_1 y_1 + c_2 y_2$, where c_1 and c_2 are arbitrary constants.

► Thinking conceptually, to solve a first-order equation, you must “undo” one derivative, which requires one integration and produces one arbitrary constant in the general solution. To solve an n th-order equation, you must “undo” n derivatives, which requires n integrations and produces n arbitrary constants in the general solution.

If y_1 and y_2 are linearly independent solutions, the function $y = c_1y_1 + c_2y_2$, where c_1 and c_2 are arbitrary real constants, is called the **general solution** of the homogeneous equation; it represents all possible homogeneous solutions.

Notice the progression here. The general solution of a first-order differential equation involves one arbitrary constant; the general solution of a second-order equation involves two arbitrary constants; and the general solution of an n th-order equation involves n arbitrary constants.

EXAMPLE 3 General solutions

- The functions $\{e^t, e^{t+2}\}$ are solutions of the equation $y'' - y = 0$, for $-\infty < t < \infty$. If possible, find a general solution of the equation.
- The functions $\{e^{4t}, e^{-4t}\}$ are solutions of the equation $y'' - 16y = 0$, for $-\infty < t < \infty$. Show that $y = \cosh 4t$ is also a solution.

SOLUTION

- Noting that $e^{t+2} = e^2e^t$, we see that e^{t+2} is a constant multiple of e^t for all t in $(-\infty, \infty)$. Therefore, the functions $\{e^t, e^{t+2}\}$ are linearly dependent, and we cannot determine the general solution from this information alone. Another linearly independent solution is needed in order to write the general solution. (You can verify that e^{-t} is a second linearly independent solution.)
- The functions $\{e^{4t}, e^{-4t}\}$ are linearly independent on $(-\infty, \infty)$ because there is no constant c such that $e^{4t} = c e^{-4t}$, for all t in $(-\infty, \infty)$. Therefore, by Theorem D2.2 we can write all solutions of the homogeneous equation in the form $c_1e^{4t} + c_2e^{-4t}$. For example, taking $c_1 = c_2 = \frac{1}{2}$, we see that $\cosh 4t = \frac{1}{2}e^{4t} + \frac{1}{2}e^{-4t}$ is also a solution.

Related Exercises 23–26 ◀

► The equation in Example 4 and more general oscillator equations are derived in Section D2.4.

EXAMPLE 4 An oscillator equation The equation $y'' + 9y = 0$ describes the motion of an oscillator such as a block on a spring in the absence of external forces such as friction. The functions $\{\sin 3t, \cos 3t\}$ are solutions of the equation, for $-\infty < t < \infty$. Find the general solution of the equation.

SOLUTION The functions $\{\sin 3t, \cos 3t\}$ are linearly independent on $(-\infty, \infty)$ because it is not possible to find a constant c such that $\sin 3t = c \cos 3t$, for all t in $(-\infty, \infty)$. Therefore, the general solution can be written in the form $y = c_1 \sin 3t + c_2 \cos 3t$, where c_1 and c_2 are real numbers.

Related Exercises 23–26 ◀

Nonhomogeneous Equations and General Solutions

We now shift our attention to linear nonhomogeneous equations of the form

$$y''(t) + p(t)y'(t) + q(t)y(t) = f(t),$$

where the function f is not identically zero on the interval of interest. As before, we assume that p , q , and f are continuous on some interval I of interest. Suppose for the moment that we have found a function that satisfies this equation. Such a solution is called a **particular solution**, and methods for finding particular solutions are discussed in Section D2.3.

EXAMPLE 5 Another oscillator equation Building on Example 4, the equation $y'' + 9y = 14 \sin 4t$ describes a spring-block system that is driven by an oscillatory external force $f(t) = 14 \sin 4t$ in the absence of friction. Show that $y_p = -2 \sin 4t$ is a particular solution of the equation.

SOLUTION Substituting $y_p = -2 \sin 4t$ into the nonhomogeneous equation, we have

$$\begin{aligned} y_p'' + 9y_p &= (-2 \sin 4t)'' + 9(-2 \sin 4t) && \text{Substitute } y_p. \\ &= -2(-16 \sin 4t) - 18 \sin 4t && (\sin 4t)'' = -16 \sin 4t \\ &= 14 \sin 4t. && \text{Simplify.} \end{aligned}$$

Therefore, y_p satisfies the nonhomogeneous equation and is a particular solution.

Related Exercises 27–30 ◀

QUICK CHECK 3 Is $y_p = -1$ a particular solution of the equation $y'' - y = 1$? ◀

Our goal is to find the general solution of a given nonhomogeneous equation; that is, a family of functions, all of which satisfy the equation. Before doing so, we can answer an important practical question right now. How many particular solutions does one equation have? When do we stop looking? Theorem D2.3 provides the answers.

THEOREM D2.3

If y_p and z_p are particular solutions of the nonhomogeneous equation $y'' + py' + qy = f$, then y_p and z_p differ by a solution of the homogeneous equation.

Proof: Let $w = y_p - z_p$ be the difference of two particular solutions and note that y_p and z_p both satisfy the nonhomogeneous equation. Substituting w into the differential equation, we find that

$$\begin{aligned} w'' + pw' + qw &= (y_p - z_p)'' + p(y_p - z_p)' + q(y_p - z_p) && \text{Substitute } w = y_p - z_p. \\ &= \underbrace{(y_p'' + py_p' + qy_p)}_f - \underbrace{(z_p'' + pz_p' + qz_p)}_f && \text{Regroup; identify particular solutions.} \\ &= f - f = 0. \end{aligned}$$

QUICK CHECK 4 Verify that $y_p = -1$ and $z_p = e^t - 1$ are particular solutions of $y'' - y = 1$ and their difference $y_p - z_p = e^t$ is a solution of the homogeneous equation $y'' - y = 0$. ◀

The practical meaning of the theorem is that if you find one particular solution, then you can stop looking. Any two particular solutions must differ by a solution of the homogeneous equation, and solutions of the homogeneous equation already appear in the general solution.

We can now describe how to find the general solution of a nonhomogeneous equation: We find the general solution of the homogeneous equation $c_1y_1 + c_2y_2$ and add to it *any* particular solution.

THEOREM D2.4

Suppose y_1 and y_2 are linearly independent solutions of the homogeneous equation $y'' + py' + qy = 0$, and y_p is *any* particular solution of the corresponding nonhomogeneous equation $y'' + py' + qy = f$. Then the general solution of the nonhomogeneous equation is

$$y = \underbrace{c_1y_1 + c_2y_2}_{\text{solution of the homogeneous equation}} + \underbrace{y_p}_{\text{particular solution}}$$

where c_1 and c_2 are arbitrary constants.

Proof: Notice that because of Theorem D2.3, we can choose any particular solution to form the general solution. We verify by substitution that $y = c_1y_1 + c_2y_2 + y_p$ satisfies the nonhomogeneous equation. Recall that y_1 and y_2 satisfy $y'' + py' + qy = 0$ and y_p satisfies $y'' + py' + qy = f$.

$$\begin{aligned}
 y'' + py' + qy &= (c_1y_1 + c_2y_2 + y_p)'' + p(c_1y_1 + c_2y_2 + y_p)' + q(c_1y_1 + c_2y_2 + y_p) \\
 &= c_1 \underbrace{(y_1'' + py_1' + qy_1)}_0 + c_2 \underbrace{(y_2'' + py_2' + qy_2)}_0 + \underbrace{(y_p'' + py_p' + qy_p)}_f \\
 &= 0 + 0 + f = f
 \end{aligned}$$

Substitute solution.
Rearrange terms.
Identify solutions.

We see that the proposed general solution satisfies the nonhomogeneous equation, as claimed. Notice that general solution of the nonhomogeneous equation also has two arbitrary constants. 

EXAMPLE 6 General solution of an oscillator equation Find the general solution of the oscillator equation $y'' + 9y = 14 \sin 4t$ (Example 5).

SOLUTION By Example 4, two linearly independent solutions of the homogeneous equation are $y_1 = \sin 3t$ and $y_2 = \cos 3t$. Using Example 5, we know that a particular solution is $y_p = -2 \sin 4t$. By Theorem D2.4, the general solution of the oscillator equation is

$$y = \underbrace{c_1 \sin 3t + c_2 \cos 3t}_{\text{solution of homogeneous equation}} - \underbrace{2 \sin 4t}_{\text{particular solution}}$$

where c_1 and c_2 are arbitrary constants.

Related Exercises 31–38 

Initial Value Problems

As mentioned at the beginning of this chapter, mathematical models that involve differential equations often take the form of an initial value problem; that is, a differential equation accompanied by initial conditions. It turns out that with second-order equations, two initial conditions are needed to specify a solution to the initial value problem. Unless there is a good reason to do otherwise, we specify the initial conditions at $t = 0$. For equations that describe the motion of an object, the initial conditions give the initial position and velocity of the object. As shown in the next example, the two initial conditions are used to determine the two arbitrary constants in the general solution.

EXAMPLE 7 Solution of an initial value problem Consider the spring-block system described in Example 6. If the block has an initial position $y(0) = 4$ and an initial velocity $y'(0) = 1$, the motion of the block is described by the initial value problem

$$\begin{aligned}
 y'' + 9y &= 14 \sin 4t && \text{Differential equation} \\
 y(0) &= 4, \quad y'(0) = 1. && \text{Initial conditions}
 \end{aligned}$$

Find the solution of the initial value problem.

SOLUTION The general solution of the differential equation was found in Example 6:

$$y = c_1 \sin 3t + c_2 \cos 3t - 2 \sin 4t.$$

To determine the two arbitrary constants c_1 and c_2 , we use the initial conditions. The first condition $y(0) = 4$ implies that

$$y(0) = c_1 \underbrace{\sin(3 \cdot 0)}_0 + c_2 \underbrace{\cos(3 \cdot 0)}_1 - 2 \underbrace{\sin(4 \cdot 0)}_0 = c_2 = 4,$$

and the constant $c_2 = 4$ is determined. Noting that

$$y' = 3c_1 \cos 3t - 3c_2 \sin 3t - 8 \cos 4t,$$

the second condition $y'(0) = 1$ implies that

$$y'(0) = 3c_1 \underbrace{\cos(3 \cdot 0)}_1 - 3c_2 \underbrace{\sin(3 \cdot 0)}_0 - 8 \underbrace{\cos(4 \cdot 0)}_1 = 3c_1 - 8 = 1;$$

it follows that $c_1 = 3$. Having determined the two arbitrary constants in the general solution, the solution of the initial value problem is

$$y = 3 \sin 3t + 4 \cos 3t - 2 \sin 4t.$$

In practice, it is advisable to check that this function does everything it is supposed to do: It must satisfy the differential equation and both initial conditions.

Figure D2.3 shows that the solution to the initial value problem (in red) is one of infinitely many functions in the general solution. It is the only one that satisfies the initial conditions.

FIGURE D2.3

Related Exercises 39–46 ◀

QUICK CHECK 5 The general solution of an equation is $y = c_1 \sin t + c_2 \cos t$. Find the constants c_1 and c_2 such that $y(0) = 1, y'(0) = 0$. ◀

Theoretical Matters

We close with two important questions. We can provide answers, but rigorous proofs go beyond the scope of this discussion and are generally given in advanced courses.

The first question concerns solutions of initial value problems. Given an initial value problem such as that in Example 7, when can we expect to find a unique solution? An answer is given in the following theorem.

- We have seen that to solve an initial value problem (the subject of Theorem D2.5), we must first find a general solution (the subject of Theorem D2.6). The theorems are given in the reverse order because the proof of Theorem D2.6 relies on the proof of Theorem D2.5.

THEOREM D2.5 Solutions of Initial Value Problems

Suppose the functions p , q , and f are continuous on an open interval I containing the point 0. Then the initial value problem

$$\begin{aligned} y''(t) + p(t)y'(t) + q(t)y(t) &= f(t) \\ y(0) &= A, \quad y'(0) = B, \end{aligned}$$

where A and B are given, has a unique solution on I .

The conditions of this theorem, namely continuity of the coefficients p , q , and f on the interval of interest, guarantee the existence and uniqueness of solutions of initial value problems on same interval. These conditions are satisfied by the equations we consider in this chapter.

The second question concerns general solutions. All the examples of this section have demonstrated that second-order linear homogeneous equations have two linearly independent solutions, which comprise the general solution. Is this observation always true? The following theorem gives an affirmative answer under appropriate conditions.

THEOREM D2.6 Linearly Independent Solutions

Suppose the functions p and q are continuous on an open interval I . Then the homogeneous equation

$$y''(t) + p(t)y'(t) + q(t)y(t) = 0$$

has two linearly independent solutions y_1 and y_2 , and the general solution on I is $y = c_1y_1 + c_2y_2$, where c_1 and c_2 are arbitrary constants.

These theorems claim the existence of solutions, but they don't say a word about *how to find* solutions. We now turn to the practical matter of actually solving differential equations.

solution $y = 2 \sin 5t - 6 \cos 5t + \frac{1}{2} \cos t$
- $y'' - y' - 2y = 0$; solution $y = c_1e^{-t} + c_2e^{2t}$
- $y'' + 2y' - 3y = 5e^{2t}$; solution $y = c_1e^{-3t} + c_2e^t + e^{2t}$
- $y'' + 6y' + 25y = 0$;
solution $y = e^{-3t}(c_1 \sin 4t + c_2 \cos 4t)$
- $y'' + 8y' + 25y = 50$;
solution $y = e^{-4t}(c_1 \sin 3t + c_2 \cos 3t) + 2$
- $ty'' - (t+1)y' + y = 0, t > 0$;
solution $y = c_1e^t + c_2(t+1)$
- $t^2y'' + 2ty' - 2y = 5t^3, t > 0$;
solution $y = c_1t^{-2} + c_2t + \frac{t^3}{2}$

Basic Skills

9–12. Classifying differential equations Determine the order of the following differential equations. Then state whether they are linear or nonlinear, and whether they are homogeneous or nonhomogeneous.

- $y'' - 4y' + 2y = 10t^2$
- $y' = 2y^3 - 4t$
- $y'' - 3yy' - y = e^t$
- $z'' + 16z = 0$

13–22. Verifying solutions Verify by substitution that the following equations are satisfied by the given functions. Assume that c_1 and c_2 are arbitrary constants.

- $y'' - 4y = 0$; solution $y = 3e^{2t} - 5e^{-2t}$

23–26. General solutions Two solutions of each of the following differential equations are given. If possible, give a general solution of the equation.

- $y'' - 36y = 0$; solutions $\{e^{6t}, 5e^{-6t}\}$
- $y'' + 5y = 0$; solutions $\{\cos \sqrt{5}t, \sin \sqrt{5}t\}$
- $y'' + 2y' + y = 0$; solutions $\{e^{-t}, te^{-t}\}$
- $t^2y'' + ty' - y = 0, t > 0$; solutions $\{t, t^{-1}\}$

27–30 Particular solutions Verify by substitution that the given functions are particular solutions of the following equations.

- $y'' - y = 8e^{-3t}$; particular solution e^{-3t}

28. $y'' + y = 3 \cos 2t$; particular solution $2 \sin t - \cos 2t$

29. $y'' - 4y' + 4y = 2e^{2t}$; particular solution $t^2 e^{2t}$

30. $t^2 y'' + ty' - 4y = 6t, t > 0$; particular solution $-2t + t^2$

31–34. Particular solutions are not unique Two functions are given for each of the following differential equations. Show that both functions are particular solutions and that they differ by a solution of the homogeneous equation.

31. $y'' - 49y = -24e^{-t}$; particular solutions $\left\{ \frac{e^{-t}}{2}, \frac{e^{-t}}{2} + 3e^{7t} \right\}$

32. $y'' + 16y = 30 \sin t$; particular solutions $\{2 \sin t, 2 \sin t - 8 \cos 4t\}$

33. $y'' - y' - 12y = 12e^t$; particular solutions $\{-e^t, 6e^{4t} - e^t\}$

34. $t^2 y'' + 2ty' - 30y = 12t^2, t > 0$;
particular solutions $\left\{ -\frac{t^2}{2}, 3t^5 - \frac{t^2}{2} \right\}$

35–38. General solutions of nonhomogeneous equations Three solutions of the following differential equations are given. Determine which two functions are solutions of the homogeneous equation and then write the general solution of the nonhomogeneous equation.

35. $y'' + 2y = 3e^t$; solutions $\{\sin \sqrt{2}t, e^t, \cos \sqrt{2}t\}$

36. $y'' - 4y = 5 \cos t$; solutions $\{5e^{2t}, e^{-2t}, -\cos t\}$

37. $y'' - 3y' + \frac{25}{4}y = 625t$; solutions $\{e^{3t/2} \cos 2t, e^{3t/2} \sin 2t, 48 + 100t\}$

38. $t^2 y'' + 2ty' - 6y = 7t^4, t > 0$; solutions $\left\{ t^{-3}, \frac{t^4}{2}, t^2 \right\}$

39–46. Initial value problems Solve the following initial value problems using the given general solution.

39. $y'' + 9y = 0$; $y(0) = 4, y'(0) = 0$;
general solution $y = c_1 \sin 3t + c_2 \cos 3t$

40. $y'' - y = 0$; $y(0) = 2, y'(0) = -2$;
general solution $y = c_1 e^t + c_2 e^{-t}$

41. $y'' - y' - 20y = 0$; $y(0) = -3, y'(0) = 3$;
general solution $y = c_1 e^{5t} + c_2 e^{-4t}$

42. $y'' + 4y = 5 \cos 3t$; $y(0) = 4, y'(0) = 2$;
general solution $y = c_1 \sin 2t + c_2 \cos 2t - \cos 3t$

43. $y'' - 16y = 16t^2$; $y(0) = 0, y'(0) = 0$;
general solution $y = c_1 e^{4t} + c_2 e^{-4t} - t^2 - \frac{1}{8}$

44. $t^2 y'' + 2ty' - 2y = 0$; $y(1) = 3, y'(1) = 0$;
general solution $y = c_1 t^{-2} + c_2 t$

45. $t^2 y'' + ty' - 4y = 0$; $y(1) = 1, y'(1) = -1$;
general solution $y = c_1 t^{-2} + c_2 t^2$

46. $y'' + 8y' + 25y = 0$; $y(0) = 1, y'(0) = -1$;
general solution $y = e^{-4t}(c_1 \sin 3t + c_2 \cos 3t)$

Further Explorations

47. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- The general solution of a second-order linear differential equation could be $y = ce^{2t} - t^2$, where c is an arbitrary constant.
- If y_h is a solution of a homogeneous differential equation $y'' + py' + qy = 0$ and y_p is a particular solution of the equation $y'' + py' + qy = f$, then $y_p + cy_h$ is also a particular solution, for any constant c .
- The functions $\{1 - \cos^2 x, 5 \sin^2 x\}$ are linearly independent on the interval $[0, 2\pi]$.
- If y_1 and y_2 are solutions of the equation $y'' + yy' = 0$, then $y_1 + y_2$ is also a solution of the equation.
- The initial value problem $y'' + 2y = 0, y(0) = 4$ has a unique solution.

48–53. Solution verification Verify by substitution that the following differential equations are satisfied by the given functions. Assume that c_1 and c_2 are arbitrary constants.

48. $y'' - 12y' + 36y = 0$; solution $y(t) = c_1 e^{6t} + c_2 t e^{6t}$

49. $y'' - 12y' + 36y = 2e^{6t}$;
solution $y = c_1 e^{6t} + c_2 t e^{6t} + t^2 e^{6t}$

50. $y'' + 4y = 8 \sin 2t$;
solution $y = c_1 \sin 2t + c_2 \cos 2t - 2t \cos 2t$

51. $t^2 y'' - 3ty' + 4y = 0, t > 0$;
solution $y = c_1 t^2 + c_2 t^2 \ln t$

52. $t^2 y'' - 3ty' + 4y = 2t^2, t > 0$;
solution $y = c_1 t^2 + c_2 t^2 \ln t + t^2 \ln^2 t$

53. $t^2 y'' + ty' + \left(t^2 - \frac{1}{4}\right)y = 0, t > 0$;
solution $y = t^{-1/2}(c_1 \cos t + c_2 \sin t)$

54. Trigonometric solutions

- Verify by substitution that $y = \sin t$ and $y = \cos t$ are solutions of the equation $y'' + y = 0$.
- Write the general solution of $y'' + y = 0$.
- Verify by substitution that $y = \sin 2t$ and $y = \cos 2t$ are solutions of the equation $y'' + 4y = 0$.
- Write the general solution of $y'' + 4y = 0$.
- Based on the results of parts (a)–(d), find the general solution of the equation $y'' + k^2 y = 0$, where k is a nonzero real number.

55. Hyperbolic functions Recall that the hyperbolic sine and cosine are defined by $\sinh t = \frac{e^t - e^{-t}}{2}$ and $\cosh t = \frac{e^t + e^{-t}}{2}$.

- Verify that $y = e^t$ and $y = e^{-t}$ are linearly independent solutions of the equation $y'' - y = 0$.
- Explain (without substituting) why $y = \sinh t$ and $y = \cosh t$ are linearly independent solutions of the same equation.
- Verify by substitution that $y = \sinh t$ and $y = \cosh t$ are solutions of $y'' - y = 0$.
- Give two different forms for the general solution of $y'' - y = 0$.

- e. Verify that for any real number k , $y = e^{kt}$ and $y = e^{-kt}$ are linearly independent solutions of the equation $y'' - k^2y = 0$.
- f. Express the general solution of $y'' - k^2y = 0$ in terms of $\{e^{kt}, e^{-kt}\}$ and $\{\sinh kt, \cosh kt\}$.

56–57. Higher-order equations Verify by substitution that the following equations are satisfied by the given functions.

56. $y''' + 2y'' - y' - 2y = 0$;
solution $y = c_1e^{-2t} + c_2e^{-t} + c_3e^t$

57. $y^{(4)} - 16y = 0$; solution
 $y = c_1e^{-2t} + c_2e^{2t} + c_3\sin 2t + c_4\cos 2t$

58–59. Nonlinear equations

58. Find the general solution of the equation $y'' - 2yy' = 0$ using the following steps.

- Use the Chain Rule to show that $\frac{d}{dt}(y(t)^2) = 2y(t)y'(t)$.
- Write the original differential equation as $y''(t) - (y(t)^2)' = 0$.
- Integrate both sides of the equation in part (b) with respect to t to obtain the first-order separable equation $y' = y^2 + c_1$.
- Solve this equation to find the general solution. Note that there are three cases to consider: $c_1 > 0$, $c_1 = 0$, and $c_1 < 0$.

59. Find the general solution of the equation $y''y' = 1$ using the following steps.

- Use the Chain Rule to show that $\frac{d}{dt}(y'(t)^2) = 2y'(t)y''(t)$.
- Write the original differential equation as $(y'(t)^2)' = 2$.
- Integrate both sides of the equation in part (b) with respect to t to obtain the first-order equation $y' = \pm\sqrt{2t + c_1}$, where c_1 is an arbitrary constant.
- Solve this equation to show that there are two families of solutions, $y = c_2 + \frac{1}{3}(2t + c_1)^{3/2}$ and $y = c_2 - \frac{1}{3}(2t + c_1)^{3/2}$, where c_2 is an arbitrary constant.

60–63. Not really second-order An equation of the form $y'' = F(t, y')$ (where F does not depend on y) can be viewed as a first-order equation in y' . It may be attacked in two steps: (a) Let $v = y'$ and solve the first-order equation $v' = F(t, v)$. (b) Having determined v , solve the first order equation $y' = v$. Use this method to find the general solution of the following equations.

60. $y'' = 2y'$
61. $y'' = 3y' + 4$
62. $y'' = e^{-y'}$
63. $y'' = 2t(y')^2$

Applications

64–67. Oscillator and circuit equations As will be shown in Section D2.4, the equation $y'' + py' + qy = f(t)$, where p and q are constants and f is a specified function, is used to model both mechanical oscillators

and electrical circuits. Depending on the values of p and q , the solutions to this equation display a wide variety of behavior.

- Verify that the following equations have the given general solution.
- Solve the initial value problem with the given initial conditions.
- Graph the solution to the initial value problem, for $t \geq 0$.

64. $y'' + 16y = 0$; $y(0) = 4$, $y'(0) = -1$
General solution $y = c_1\sin 4t + c_2\cos 4t$

65. $y'' + 3y' + \frac{25}{4}y = 0$; $y(0) = 4$, $y'(0) = 0$.
General solution $y = e^{-3t/2}(c_1\sin 2t + c_2\cos 2t)$

66. $y'' + 9y = 8\sin t$; $y(0) = 0$, $y'(0) = 2$.
General solution $y = c_1\sin 3t + c_2\cos 3t + \sin t$

67. $y'' + 6y' + 25y = 20e^{-t}$; $y(0) = 2$, $y'(0) = 0$.
General solution $y = e^{-3t}(c_1\sin 4t + c_2\cos 4t) + e^{-t}$

- 68. A pursuit problem** Imagine a dog standing at the origin and its master standing on the positive x -axis one mile from the origin (see figure). At the same instant the dog and master begin walking. The dog walks along the positive y -axis at 1 mile per hour and the master walks at $s > 1$ miles per hour on a path that is always directed at the moving dog. The path followed by the master in the xy -plane is the solution of the initial value problem

$$y''(x) = \frac{\sqrt{1 + y'(x)^2}}{sx}, y(1) = 0, y'(1) = 0$$

Solve this initial value problem using the following steps.

- Notice that the equation is first-order in y' ; so let $u = y'$, which results in the initial value problem $u' = \frac{\sqrt{1 + u^2}}{sx}$, $u(1) = 0$.
- Solve this separable equation using the fact that $\int \frac{du}{\sqrt{1 + u^2}} = \ln(u + \sqrt{1 + u^2}) + c_1$ to obtain the general solution $u + \sqrt{1 + u^2} = c_1x^{1/s}$.
- Use the initial condition $u(1) = 0$ to evaluate c_1 and show that $u = \frac{1}{2}(x^{1/s} - x^{-1/s})$.
- Now recall that $u = y'$. Solve the equation $u = y' = \frac{1}{2}(x^{1/s} - x^{-1/s})$ by integrating both sides with respect to x .

- e. Use the initial condition $y(1) = 0$ to evaluate the constant of integration.
 f. Conclude that the path of the master is given by

$$y = \frac{sx}{2} \left(\frac{x^{1/s}}{s+1} - \frac{x^{-1/s}}{s-1} \right) + \frac{s}{s^2-1}.$$

- g. Graph the pursuit paths for $s = 1.1, 1.3, 1.5, 2.0$. Explain the dependence on s that you observe.

Additional Exercises

- 69. Conservation of energy** In some cases, Newton's second law can be written $mx''(t) = F(x)$, where the force F depends only on the position x , and there is a function φ (called a potential) such that $\varphi'(x) = -F(x)$. Systems with this property obey an energy conservation law.

- a. Multiply the equation of motion by $x'(t)$ and show that the equation can be written

$$\frac{d}{dt} \left[\frac{1}{2} m (x'(t))^2 + \varphi(x) \right] = \frac{d}{dt} \left[\frac{1}{2} m v^2 + \varphi(x) \right] = 0.$$

- b. Define the energy of the system to be $E(t) = \frac{1}{2} m v^2 + \varphi$ (the sum of kinetic and potential energy) and show that $E(t)$ is constant in time.

- 70. Reduction of order** Suppose you are solving a second-order linear homogeneous differential equation and you have found one solution. A method called *reduction of order* allows you to find

the second (linearly independent) solution (up to evaluating integrals). Consider the differential equation $y'' - \frac{1}{t}y' + \frac{1}{t^2}y = 0$, for $t > 0$.

- a. Verify that $y_1 = t$ is a solution. Assume the second homogeneous solution is y_2 and it has the form $y_2(t) = v(t)y_1(t) = v(t)t$, where v is a function to be determined.
 b. Substitute y_2 into the differential equation and simplify the resulting equation to show that v satisfies the equation $v'' = -\frac{v'}{t}$.
 c. Note that this equation is first order in v' ; so let $w = v'$ to obtain the first-order equation $w' = -\frac{w}{t}$.
 d. Solve this separable equation and show that $w = \frac{c_1}{t}$.
 e. Now solve the equation $v' = w = \frac{c_1}{t}$ to find v .
 f. Finally, recall that $y_2(t) = v(t)t$ and conclude that the second solution is $y_2(t) = c_1 t \ln t$.

QUICK CHECK ANSWERS

1. First order, linear, nonhomogeneous; second order, linear, homogeneous 2. The first, third, and fourth pairs are linearly independent. The second pair is linearly dependent.
 3. Yes. 5. $c_1 = 0, c_2 = 1$. ◀

D2.2 Linear Homogeneous Equations

Up until now, you have been given a function and asked to verify by substitution that it satisfies a particular differential equation. Now it's time to carry out the actual solution process. We begin with the case of constant-coefficient homogeneous equations of the form

$$y''(t) + py'(t) + qy(t) = 0,$$

where p and q are constants.

QUICK CHECK 1 Let $y = e^{rt}$ and show that y' and y'' are constant multiples of y . ◀

We solve this equation by making the following observation: A solution of this equation is a function y whose derivatives y' and y'' are constant multiples of y itself, for all t . The only functions with this property have the form $y = e^{rt}$, where r is a constant.

This observation suggests using a *trial solution* of the form $y = e^{rt}$, where r must be determined. We substitute the trial solution into the equation and carry out the following calculation.

$$\underbrace{(e^{rt})''}_{r^2 e^{rt}} + p \underbrace{(e^{rt})'}_{r e^{rt}} + q e^{rt} = 0 \quad \text{Substitute.}$$

$$r^2 e^{rt} + p r e^{rt} + q e^{rt} = 0 \quad \text{Differentiate.}$$

$$e^{rt}(r^2 + pr + q) = 0 \quad \text{Factor } e^{rt}.$$

- Notice that you do not need to substitute the trial solution into every differential equation you solve. The characteristic polynomial can be read directly from the differential equation; the order of the derivative becomes the power of r .

$$\begin{aligned}y'' &\rightarrow r^2 \\py' &\rightarrow pr \\qy &\rightarrow q\end{aligned}$$

Recall that our aim is to find values of r that satisfy this equation for all t . We may cancel the factor e^{rt} because it is nonzero for all t . What remains after canceling e^{rt} is a quadratic (second-degree) equation

$$r^2 + pr + q = 0,$$

which can be solved for the unknown r . The polynomial $r^2 + pr + q$ is called the **characteristic polynomial** (or **auxiliary polynomial**) for the differential equation.

It is important to see what the roots of the characteristic polynomial look like. Using the quadratic formula, they are

$$r_1 = \frac{-p + \sqrt{p^2 - 4q}}{2} \quad \text{and} \quad r_2 = \frac{-p - \sqrt{p^2 - 4q}}{2}. \quad (1)$$

Recall that three cases arise.

- If $p^2 - 4q > 0$, then the roots are real with $r_1 \neq r_2$, and they are expressed exactly as in expression (1).
- If $p^2 - 4q = 0$, then the polynomial has the repeated root $r_1 = r_2 = -\frac{p}{2}$.
- If $p^2 - 4q < 0$, then polynomial has a pair of complex roots

$$r_1 = \frac{-p + i\sqrt{4q - p^2}}{2} \quad \text{and} \quad r_2 = \frac{-p - i\sqrt{4q - p^2}}{2}.$$

QUICK CHECK 2 What is the characteristic polynomial for the equation $y'' - y = 0$? What are the roots of the polynomial? ◀

These three cases produce different types of solutions to the differential equation, and we must examine them individually.

Case 1: Real Distinct Roots of the Characteristic Polynomial

Suppose that $p^2 - 4q > 0$ and the roots of the characteristic polynomial are real numbers r_1 and r_2 , with $r_1 \neq r_2$. We assumed that solutions of the differential equation have the form $y = e^{rt}$. Therefore, we have found two solutions, $y_1 = e^{r_1 t}$ and $y_2 = e^{r_2 t}$, which are linearly independent because $r_1 \neq r_2$. Using what we learned in Section D2.1, the general solution of the differential equation consists of linear combinations of these two functions:

$$y = c_1 y_1 + c_2 y_2 = c_1 e^{r_1 t} + c_2 e^{r_2 t}.$$

EXAMPLE 1 General solution with real distinct roots Find the general solution of the differential equation

$$y'' - 2y' - 4y = 0.$$

SOLUTION We form the characteristic polynomial directly from the differential equation; the equation that must be solved is

$$r^2 - 2r - 4 = 0.$$

Using the quadratic formula, the roots are found to be

$$r_1 = 1 + \sqrt{5} \quad \text{and} \quad r_2 = 1 - \sqrt{5}.$$

Therefore, the general solution is

$$y = c_1 e^{(1+\sqrt{5})t} + c_2 e^{(1-\sqrt{5})t},$$

where c_1 and c_2 are arbitrary constants.

Related Exercises 9–14 ◀

EXAMPLE 2 Initial value problem with real distinct roots Solve the initial value problem

$$y'' + y' - 6y = 0, \quad y(0) = 0, \quad y'(0) = -5.$$

SOLUTION To find the general solution, we find the roots of the characteristic polynomial, which satisfy

$$r^2 + r - 6 = 0.$$

Factoring the polynomial or using the quadratic formula, the roots are $r_1 = 2$ and $r_2 = -3$. Therefore, the general solution is

$$y = c_1 e^{2t} + c_2 e^{-3t}.$$

The arbitrary constants c_1 and c_2 are now determined using the initial conditions. Noting that $y'(t) = 2c_1 e^{2t} - 3c_2 e^{-3t}$, the initial conditions imply that

$$\begin{aligned} y(0) &= c_1 e^{2 \cdot 0} + c_2 e^{-3 \cdot 0} = c_1 + c_2 = 0 \\ y'(0) &= 2c_1 e^{2 \cdot 0} - 3c_2 e^{-3 \cdot 0} = 2c_1 - 3c_2 = -5. \end{aligned}$$

Solving these two equations gives the constants $c_1 = -1$ and $c_2 = 1$. The solution of the initial value problem now follows; it is

$$y = -e^{2t} + e^{-3t}.$$

Figure D2.4 shows that the solution to the initial value problem (in red) is one of infinitely many functions of the general solution. It is the only function that satisfies the initial conditions.

FIGURE D2.4

Related Exercises 15–20 ◀

Case 2: Real Repeated Roots of the Characteristic Polynomial

We now assume that $p^2 - 4q = 0$, which means the only root of the characteristic polynomial is

$$r_1 = \frac{-p + \overbrace{\sqrt{p^2 - 4q}}^0}{2} = -\frac{p}{2}$$

This one root produces the solution $y_1 = c_1 e^{r_1 t}$, but where do we find a second (linearly independent) solution? It may be found by making an ingenious assumption followed by a short calculation.

Because the first solution has the form $y_1 = c_1 e^{r_1 t}$, where c_1 is a constant, we look for a second solution that has the form $y_2 = v(t) e^{r_1 t}$, where $v(t)$ is not a constant, but a

function of t that must be determined. In the spirit of a trial solution, we substitute y_2 into the differential equation and see where it takes us.

By the Product Rule

$$\begin{aligned}y_2'(t) &= v'(t)e^{r_1 t} + v(t)r_1 e^{r_1 t} \quad \text{and} \\y_2''(t) &= v''(t)e^{r_1 t} + 2v'(t)r_1 e^{r_1 t} + v(t)r_1^2 e^{r_1 t}.\end{aligned}$$

► The method used to find y_2 is called *reduction of order*. It may be applied to any second-order linear equation to find a second homogeneous solution when one homogeneous solution is known.

We now substitute y_2 into the differential equation $y'' + py' + qy = 0$:

$$\begin{aligned}&\underbrace{v''e^{r_1 t} + 2v'r_1 e^{r_1 t} + vr_1^2 e^{r_1 t}}_{y_2''} + p\underbrace{(v'e^{r_1 t} + vr_1 e^{r_1 t})}_{y_2'} + \underbrace{qve^{r_1 t}}_{y_2} \quad \text{Substitute.} \\&= e^{r_1 t}(v'' + \underbrace{(2r_1 + p)v'}_0 + \underbrace{v(r_1^2 + pr_1 + q)}_0) \quad \text{Collect terms.} \\&= e^{r_1 t}v'' = 0. \quad r_1 = -\frac{p}{2} \text{ is a root.}\end{aligned}$$

We used the fact that $2r_1 + p = 0$ because $r_1 = -\frac{p}{2}$. In addition, r_1 is a root of the characteristic polynomial, which implies that $r_1^2 + pr_1 + q = 0$. After making these simplifications, we are left with the equation $e^{r_1 t}v''(t) = 0$. Because $e^{r_1 t}$ is nonzero for all t , we cancel this factor, leaving an equation for the unknown function v ; it is simply $v''(t) = 0$.

We solve this equation by integrating once to give $v'(t) = c_1$, and then again to give $v(t) = c_1 t + c_2$, where c_1 and c_2 are arbitrary constants. Remember that this calculation began by assuming that the second homogeneous solution has the form $y_2 = v(t)e^{r_1 t}$. Now that we have found v , we can write

$$y_2 = v(t)e^{r_1 t} = (c_1 t + c_2)e^{r_1 t} = \underbrace{c_1 t e^{r_1 t}}_{\text{new solution}} + \underbrace{c_2 e^{r_1 t}}_{y_1}$$

QUICK CHECK 3 What is the characteristic polynomial for the equation $y'' + 2y' + y = 0$? Give the two linearly independent solutions of the equation. ◀

This calculation has produced the first solution $y_1 = e^{r_1 t}$, as well as the second solution that we sought, $y_2 = te^{r_1 t}$. So the mystery is solved. The two linearly independent solutions are $\{e^{r_1 t}, te^{r_1 t}\}$, and the general solution in the repeated root case is

$$y = c_1 e^{r_1 t} + c_2 t e^{r_1 t}.$$

EXAMPLE 3 Initial value problem with repeated roots Solve the initial value problem

$$y'' + 4y' + 4y = 0, \quad y(0) = 8, \quad y'(0) = 4.$$

SOLUTION Solving the equation

$$r^2 + 4r + 4 = (r + 2)^2 = 0,$$

the characteristic polynomial has the single repeated root $r_1 = -2$. Therefore, the general solution of the differential equation is

$$y = c_1 e^{-2t} + c_2 t e^{-2t}.$$

We appeal to the initial conditions to evaluate the constants in the general solution. In this case,

$$y'(t) = -2c_1 e^{-2t} + c_2(e^{-2t} - 2te^{-2t}) = e^{-2t}(-2c_1 + c_2 - 2tc_2).$$

The initial conditions imply that

$$\begin{aligned}y(0) &= c_1 e^{-2 \cdot 0} + c_2 \cdot 0 \cdot e^{-2 \cdot 0} = c_1 = 8 \\y'(0) &= e^{-2 \cdot 0}(-2c_1 + c_2 - 2 \cdot 0 \cdot c_2) = -2c_1 + c_2 = 4.\end{aligned}$$

Solving these two equations gives the solutions $c_1 = 8$ and $c_2 = 20$. The solution of the initial value problem is

$$y = 8e^{-2t} + 20te^{-2t}.$$

The behavior of this solution is worth investigating because solutions of this form arise in practice. Figure D2.5 shows several functions of the general solution along with the function that satisfies the initial value problem (in red). Of particular importance is the fact that for all these solutions, $\lim_{t \rightarrow \infty} y(t) = 0$. In general, when $a > 0$, we have $\lim_{t \rightarrow \infty} te^{-at} = 0$ and $\lim_{t \rightarrow \infty} te^{at} = \infty$.

FIGURE D2.5

Related Exercises 21–26 ◀

Case 3: Complex Roots of the Characteristic Polynomial

The third case arises when $p^2 - 4q < 0$, which implies that the roots of the characteristic polynomial occur in complex conjugate pairs. The roots are

$$r_1 = \frac{-p + i\sqrt{4q - p^2}}{2} \quad \text{and} \quad r_2 = \frac{-p - i\sqrt{4q - p^2}}{2},$$

which we abbreviate as $r_1 = a + ib$ and $r_2 = a - ib$, where $a = -\frac{p}{2}$ and $b = \frac{\sqrt{4q - p^2}}{2}$ are real numbers. It is easy to write the general solution of the differential equation as

$$y = c_1 e^{r_1 t} + c_2 e^{r_2 t} = c_1 e^{(a+ib)t} + c_2 e^{(a-ib)t},$$

but what does it mean? We expect a real-valued solution to a differential equation with real coefficients. A bit of work is required to express this solution with real-valued functions. Using properties of exponential functions, we first factor e^{at} and write

$$y = e^{at}(c_1 e^{ibt} + c_2 e^{-ibt}).$$

Written in this form, we see that two solutions of the differential equation are $e^{at}e^{ibt}$ and $e^{at}e^{-ibt}$. Now recall that linear combinations of solutions are also solutions. We use the facts that

$$\cos bt = \frac{e^{ibt} + e^{-ibt}}{2} \quad \text{and} \quad \sin bt = \frac{e^{ibt} - e^{-ibt}}{2i}$$

to form the following linear combinations:

$$\begin{aligned} \frac{1}{2}e^{at}e^{ibt} + \frac{1}{2}e^{at}e^{-ibt} &= e^{at} \cdot \frac{e^{ibt} + e^{-ibt}}{2} = e^{at} \cos bt \\ \frac{1}{2i}e^{at}e^{ibt} - \frac{1}{2i}e^{at}e^{-ibt} &= e^{at} \cdot \frac{e^{ibt} - e^{-ibt}}{2i} = e^{at} \sin bt. \end{aligned}$$

► The complex conjugate of $a + ib$ is $a - ib$.

Now we have two real-valued, linearly independent solutions: $e^{at} \cos bt$ and $e^{at} \sin bt$. Therefore, in the case of complex roots, the general solution is

$$y = c_1 e^{at} \cos bt + c_2 e^{at} \sin bt,$$

where $a = -\frac{p}{2}$ and $b = \frac{\sqrt{4q - p^2}}{2}$. Recall that the roots of the characteristic polynomial are $a \pm ib$. Therefore, the real part of each root is a , which determines the rate of exponential growth or decay of the solution. The imaginary part of each root is b , which determines the period of oscillation of the solution; we see that the period is $2\pi/b$.

QUICK CHECK 4 What is the characteristic polynomial for the equation $y'' + y = 0$? What are the roots of the polynomial? ◀

EXAMPLE 4 Initial value problem with complex roots Solve the initial value problem

$$y'' + 16y = 0, \quad y(0) = -2, \quad y'(0) = 6.$$

SOLUTION The roots of the characteristic polynomial satisfy $r^2 + 16 = 0$; in this case, we have the pure imaginary roots $r_1 = 4i$ and $r_2 = -4i$. Therefore, the general solution $y = c_1 e^{at} \cos bt + c_2 e^{at} \sin bt$ with $a = 0$ and $b = 4$ becomes

$$y = c_1 \cos 4t + c_2 \sin 4t.$$

Before using the initial conditions, we compute $y'(t) = -4c_1 \sin 4t + 4c_2 \cos 4t$. The initial conditions imply that

$$y(0) = c_1 \cos(4 \cdot 0) + c_2 \sin(4 \cdot 0) = c_1 = -2$$

$$y'(0) = -4c_1 \sin(4 \cdot 0) + 4c_2 \cos(4 \cdot 0) = 4c_2 = 6.$$

We conclude that $c_1 = -2$ and $c_2 = \frac{3}{2}$, making the solution of the initial value problem

$$y = -2 \cos 4t + \frac{3}{2} \sin 4t.$$

The solution is shown in Figure D2.6 (in red), along with several other functions of the general solution. When the roots of the characteristic polynomial are pure imaginary numbers, as in this case, the solution is oscillatory with no growth or attenuation of the solution. In this case, with $b = 4$, the period of the solution is $2\pi/4 = \pi/2$.

FIGURE D2.6

Related Exercises 27–32 ◀

EXAMPLE 5 Initial value problem with complex roots Solve the initial value problem

$$y'' + y' + \frac{5}{4}y = 0, \quad y(0) = 2, \quad y'(0) = 2.$$

SOLUTION Using the quadratic formula, the characteristic polynomial $r^2 + r + \frac{5}{4}$ has roots $r_1 = -\frac{1}{2} + i$ and $r_2 = -\frac{1}{2} - i$. Identifying $a = -\frac{1}{2}$ and $b = 1$, the general solution is

$$y = c_1 e^{-t/2} \cos t + c_2 e^{-t/2} \sin t.$$

Before using the initial conditions, we compute

$$y'(t) = c_1 \left(-\frac{1}{2} e^{-t/2} \cos t - e^{-t/2} \sin t \right) + c_2 \left(-\frac{1}{2} e^{-t/2} \sin t + e^{-t/2} \cos t \right).$$

The initial conditions imply that

$$y(0) = c_1 = 2$$

$$y'(0) = -\frac{1}{2}c_1 + c_2 = 2.$$

These conditions are satisfied provided $c_1 = 2$ and $c_2 = 3$. Therefore, the solution to the initial value problem is

$$y = 2e^{-t/2} \cos t + 3e^{-t/2} \sin t.$$

The solution is a wave with an attenuated amplitude (Figure D2.7). The damped wave fits nicely within an envelope formed by functions of the form $y = \pm Ae^{-t/2}$ (dashed curves).

FIGURE D2.7

Related Exercises 27–32 ◀

FIGURE D2.8

Figure D2.8 gives a graphical interpretation in the pq -plane of the three cases that arise in solving the equation $y'' + py' + qy = 0$. We see that the parabola $q = \frac{p^2}{4}$ divides the plane into two regions. Values of (p, q) above the parabola correspond to equations whose characteristic polynomials have complex roots, whereas those values below the parabola correspond to the case of real distinct roots. The parabola itself represents the case of repeated real roots. Table D2.1 also summarizes the three cases.

Table D2.1 Cases for the equation $y'' + py' + qy = 0$

	Roots	General solution
$p^2 - 4q > 0$	$r_{1,2} = \frac{-p \pm \sqrt{p^2 - 4q}}{2}$	$y = c_1 e^{r_1 t} + c_2 e^{r_2 t}$
$p^2 - 4q = 0$	$r_1 = r_2 = -\frac{p}{2}$	$y = c_1 e^{r_1 t} + c_2 t e^{r_1 t}$
$p^2 - 4q < 0$	$r_{1,2} = a \pm ib, a = -\frac{p}{2}, b = \frac{\sqrt{4q - p^2}}{2}$	$y = e^{at}(c_1 \sin bt + c_2 \cos bt)$

Amplitude-Phase Form

We pause here to mention two techniques that appear in upcoming work. The use of the amplitude-phase form of a solution may be familiar, but it's worth reviewing. A function of the form $y = c_1 \sin \omega t + c_2 \cos \omega t$ (which arises in solutions in Case 3 above) is difficult to visualize. However, functions of this form may always be expressed in the form $y = A \sin(\omega t + \varphi)$ or $y = A \cos(\omega t + \varphi)$. If we choose $y = A \sin(\omega t + \varphi)$, the relationships among the *amplitude* A , the *phase* φ , and c_1 and c_2 are

$$A = \sqrt{c_1^2 + c_2^2} \quad \text{and} \quad \tan \varphi = \frac{c_2}{c_1}.$$

(See Exercise 40; Exercise 41 gives similar expressions for $A \cos(\omega t + \varphi)$.) The function $y = A \sin(\omega t + \varphi)$ is a shifted sine function with constant amplitude A and frequency ω . For example, consider the function $y = -2 \sin 3t + 2 \cos 3t$. Letting $c_1 = -2$ and $c_2 = 2$, we have

$$A = \sqrt{(-2)^2 + 2^2} = 2\sqrt{2} \quad \text{and} \quad \tan \varphi = \frac{2}{-2},$$

which implies that $\varphi = \frac{3\pi}{4}$. Therefore, the function can also be written as

$$y = 2\sqrt{2} \sin\left(3t + \frac{3\pi}{4}\right) = 2\sqrt{2} \sin 3\left(t + \frac{\pi}{4}\right).$$

The function is now seen to be a sine wave with amplitude $2\sqrt{2}$ and period $\frac{2\pi}{3}$, shifted $\frac{\pi}{4}$ units to the left (Figure D2.9).

**FIGURE D2.9**

► We use the coordinate definition

$\tan \varphi = \frac{y}{x}$ to determine φ . In this case

$y > 0$ and $x < 0$. Therefore, φ is an angle in the second quadrant.

The Phase Plane

In the remainder of this chapter, we occasionally use the *phase plane* to display solutions of differential equations. Rather than graph the solution y as a function of t , we instead make a parametric plot of y and y' . The phase plane reveals features of the solution that may not be apparent in the usual time-dependent graph.

Consider the periodic function $y = \sin t - 2 \cos t$, whose graph is shown in Figure D2.10a. In the phase-plane graph of the function (Figure D2.10b), the parameter t does not appear explicitly. However, the curve has an orientation (indicated by the arrow) that shows the direction of increasing t . Any point on the curve corresponds to at least one solution value; for example, the point $(y(0), y'(0))$ (shown on the curve) is also associated with $t = 2\pi, 4\pi, \dots$. The fact that the curve is closed reflects the fact that the function is periodic.

FIGURE D2.10

In contrast, consider the function $y = e^{-t/4}(\sin t - 2 \cos t)$, whose graph is shown in Figure D2.11a. The phase-plane plot (Figure D2.11b) is an inward spiral that gives a distinctive picture of the decaying amplitude of the function.

FIGURE D2.11

The Cauchy-Euler Equation

We close this section with a brief look at a second-order linear *variable-coefficient* equation that can also be solved using roots of polynomials. The **Cauchy-Euler** (or **equidimensional**) equation has the form

$$t^2 y''(t) + aty'(t) + by(t) = 0,$$

where a and b are constants and $t > 0$. The defining feature of this equation is that in each term the power of t matches the order of the derivative. Assuming $t > 0$, both sides of the equation may be divided by t^2 to produce the equation

$$y''(t) + \frac{a}{t}y'(t) + \frac{b}{t^2}y(t) = 0.$$

We see that the coefficients of y' and y are not continuous on any interval containing $t = 0$. For this reason, initial value problems associated with this equation are posed on intervals that do not include the origin.

The equation is solved using a trial solution of the form $y = t^p$, where the exponent p must be determined. Substituting the trial solution into the differential equation, we find that

$$t^2(t^p)'' + at(t^p)' + b(t^p) = 0 \quad \text{Substitute trial solution.}$$

$$p(p-1)t^p + apt^p + bt^p = 0 \quad \text{Differentiate.}$$

$$t^p(p(p-1) + ap + b) = 0 \quad \text{Collect terms.}$$

$$t^p(p^2 + (a-1)p + b) = 0 \quad \text{Simplify.}$$

If we assume that $t > 0$, then $t^p > 0$ and we may divide through the equation by t^p . Doing so leaves a polynomial equation to be solved for the unknown p . When the quadratic equation $p^2 + (a-1)p + b = 0$ is solved, we again have three cases. If the roots are real and distinct, call them p_1 and p_2 with $p_1 \neq p_2$, then we have two linearly independent solutions $\{t^{p_1}, t^{p_2}\}$. The general solution of the differential equation is

$$y = c_1 t^{p_1} + c_2 t^{p_2}.$$

The cases in which the roots are real and repeated, and in which the roots are complex, are examined in Exercises 52–59 and 62–64.

QUICK CHECK 5 What is the polynomial associated with the equation $t^2 y'' + ty' - y = 0$? What are the roots of the polynomial? ◀

EXAMPLE 6 Cauchy-Euler initial value problem Solve the initial value problem

$$t^2 y'' + 2ty' - 2y = 0, \quad y(1) = 0, \quad y'(1) = 3.$$

SOLUTION Substituting the trial solution $y = t^p$ into the differential equation produces the polynomial

$$p^2 + p - 2 = (p-1)(p+2) = 0.$$

The roots are $p_1 = 1$ and $p_2 = -2$, which gives the general solution

$$y = c_1 t + c_2 t^{-2}.$$

To impose the initial conditions, we must compute

$$y'(t) = c_1 - 2c_2 t^{-3}.$$

The initial conditions now imply that

$$y(1) = c_1 + c_2 = 0$$

$$y'(1) = c_1 - 2c_2 = 3.$$

The solution of this set of equations is $c_1 = 1$ and $c_2 = -1$. Therefore, the solution of the initial value problem is

$$y = t - t^{-2}.$$

Several functions of the general solution along with the solution of the initial value problem (in red) are shown in Figure D2.12. Related Exercises 33–38 ◀

SECTION D2.2 EXERCISES

Review Questions

1. Give the trial solution used to solve linear constant-coefficient homogeneous differential equations.
2. What is the characteristic polynomial associated with the equation $y'' - 3y' + 10 = 0$?
3. Give the three cases that arise when finding the roots of the characteristic polynomial.
4. What is the form of the general solution of a second-order constant-coefficient equation when the characteristic polynomial has two distinct real roots?
5. What is the form of the general solution of a second-order constant-coefficient equation when the characteristic polynomial has repeated real roots?
6. What is the form of the general solution of a second-order constant-coefficient equation when the characteristic polynomial has complex roots?
7. The characteristic polynomial for a second-order equation has roots $-2 \pm 3i$. Give the real form of the general solution.
8. Give the trial solution used to solve a second-order Cauchy-Euler equation.

Basic Skills

9–14. General solutions with distinct real roots Find the general solution of the following differential equations.

9. $y'' - 25y = 0$
10. $y'' - 2y' - 15y = 0$
11. $y'' - 3y' = 0$
12. $y'' - y' - \frac{3}{4}y = 0$
13. $2y'' + 6y' - 20y = 0$
14. $y'' - \frac{5}{2}y' + y = 0$

15–20. Initial value problems with distinct real roots Find the general solution of the following differential equations. Then solve the given initial value problem.

15. $y'' - 36y = 0; y(0) = 3, y'(0) = 0$
16. $y'' - 6y' = 0; y(0) = -1, y'(0) = 2$
17. $y'' - 3y' - 18y = 0; y(0) = 0, y'(0) = 4$
18. $y'' + 8y' + 15y = 0; y(0) = 2, y'(0) = 4$
19. $y'' - 2y' - \frac{5}{4}y = 0; y(0) = 3, y'(0) = 0$
20. $y'' - 10y' + 21y = 0; y(0) = -3, y'(0) = -1$

21–26. Initial value problems with repeated real roots Find the general solution of the following differential equations. Then solve the given initial value problem.

21. $y'' - 2y' + y = 0; y(0) = 4, y'(0) = 0$
22. $y'' + 6y' + 9y = 0; y(0) = 0, y'(0) = -1$
23. $y'' - y' + \frac{1}{4}y = 0; y(0) = 1, y'(0) = 2$
24. $y'' - 4\sqrt{2}y' + 8y = 0; y(0) = 1, y'(0) = 0$
25. $y'' + 4y' + 4y = 0; y(0) = 1, y'(0) = 0$
26. $y'' + 3y' + \frac{9}{4}y = 0; y(0) = 0, y'(0) = 3$

27–32. Initial value problems with complex roots Find the general solution of the following differential equations. Then solve the given initial value problem.

27. $y'' + 9y = 0; y(0) = 8, y'(0) = -8$
28. $y'' + 6y' + 25y = 0; y(0) = 4, y'(0) = 0$
29. $y'' - 2y' + 5y = 0; y(0) = 1, y'(0) = -1$
30. $y'' + 4y' + 5y = 0; y(0) = 2, y'(0) = -2$
31. $y'' + 6y' + 10y = 0; y(0) = 0, y'(0) = 6$
32. $y'' - y' + \frac{1}{2}y = 0; y(0) = 3, y'(0) = -2$

33–38. Initial value problems with Cauchy-Euler equations Find the general solution of the following differential equations, for $t \geq 1$. Then solve the given initial value problem.

33. $t^2y'' + ty' - y = 0; y(1) = 2, y'(1) = 0$
34. $t^2y'' + 2ty' - 12y = 0; y(1) = 0, y'(1) = 6$
35. $t^2y'' - ty' - 15y = 0; y(1) = 6, y'(1) = -1$
36. $t^2y'' + 4ty' - 4y = 0; y(1) = 5, y'(1) = -3$
37. $t^2y'' + 6ty' + 6y = 0; y(1) = 0, y'(1) = -4$
38. $t^2y'' + ty' - 2y = 0; y(1) = 8, y'(1) = -12$

Further Explorations

39. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- a. To solve the equation $y'' + ty' + 4y = 0$ you should use the trial solution $y = e^{rt}$.
- b. The equation $y'' + ty' + 4t^2y = 0$ is a Cauchy-Euler equation.
- c. A second-order differential equation with constant real coefficients has a characteristic polynomial with roots $2 + 3i$ and $-2 + 3i$.
- d. The general solution of a second-order homogeneous differential equation with constant real coefficients could be $y = c_1 \cos 2t + c_2 \sin t \cos t$.
- e. The general solution of a second-order homogeneous differential equation with constant real coefficients could be $y = c_1 \cos 2t + c_2 \sin 3t$.

40. Amplitude-phase form The goal is to express the function $y = c_1 \sin \omega t + c_2 \cos \omega t$ in the form $y = A \sin(\omega t + \varphi)$, where c_1 and c_2 are known, and A and φ must be determined.

- Use the identity $\sin(u + v) = \sin u \cos v + \cos u \sin v$ to expand $y = A \sin(\omega t + \varphi)$.
- Equate the result of part (a) to $y = c_1 \sin \omega t + c_2 \cos \omega t$, and match coefficients of $\sin \omega t$ and $\cos \omega t$ to conclude that $c_1 = A \cos \varphi$ and $c_2 = A \sin \varphi$.
- Solve for A and φ to conclude that $A = \sqrt{c_1^2 + c_2^2}$ and $\tan \varphi = \frac{c_2}{c_1}$.

41. Amplitude-phase form The function $y = c_1 \sin \omega t + c_2 \cos \omega t$ can also be expressed in the form $y = A \cos(\omega t + \varphi)$, where c_1 and c_2 are known, and A and φ must be determined. Use the procedure in Exercise 40 with the identity $\cos(u + v) = \cos u \cos v - \sin u \sin v$ to conclude that $A = \sqrt{c_1^2 + c_2^2}$ and $\tan \varphi = -\frac{c_1}{c_2}$.

42–45. Converting to amplitude-phase form Express the following functions in the form $y = A \sin(\omega t + \varphi)$. Check your work by graphing both forms of the function.

- $y = 2 \sin 3t - 2 \cos 3t$
- $y = -3 \sin 4t + 3 \cos 4t$
- $y = \sqrt{3} \sin t + \cos t$
- $y = -\sin 2t + \sqrt{3} \cos 2t$

46–51. Higher-order equations Higher-order equations with constant coefficients can also be solved using the trial solution $y = e^{rt}$ and finding roots of a characteristic polynomial. Find the general solution of the following equations.

- $y''' - 4y' = 0$
- $y''' - y'' - 6y' = 0$
- $y''' + y' = 0$
- $y''' - 6y'' + 8y' = 0$
- $y^{(4)} - 5y'' + 4y = 0$
- $y^{(4)} + 5y'' + 4y = 0$

52–55. Cauchy-Euler equation with repeated roots It can be shown (Exercise 62) that when the polynomial associated with a second-order Cauchy-Euler equation has the repeated root $r = r_1$, the second linearly independent solution is $y = t^{r_1} \ln t$, for $t > 0$. Find the general solution of the following equations.

- $t^2 y'' - ty' + y = 0$
- $t^2 y'' + 3ty' + y = 0$
- $t^2 y'' - 3ty' + 4y = 0$
- $t^2 y'' + 7ty' + 9y = 0$

56–59. Cauchy-Euler equation with complex roots It can be shown (Exercise 64) that when the polynomial associated with a second-order Cauchy-Euler equation has complex roots $r = \alpha \pm i\beta$, the linearly independent solutions are $\{t^\alpha \cos(\beta \ln t), t^\alpha \sin(\beta \ln t)\}$, for $t > 0$. Find the general solution of the following equations.

- $t^2 y'' + ty' + y = 0$
- $t^2 y'' + 7ty' + 25y = 0$
- $t^2 y'' - ty' + 5y = 0$
- $t^2 y'' + \frac{1}{2}y = 0$

Applications

Section D2.4 is devoted to applications of second-order equations.

60. Oscillators and circuits As we show in Section D2.4, the equation $y'' + py' + qy = 0$ is used to model mechanical oscillators and electrical circuits in the absence of external forces (often called free oscillations). Consider this equation in the case of complex roots ($p^2 - 4q < 0$), in which case the general solution has the form $e^{at}(c_1 \cos bt + c_2 \sin bt)$.

- In the general solution, let $a = -\frac{1}{2}$, $c_1 = 2$, and $c_2 = 0$. Graph the solution on the interval $0 \leq t \leq 2\pi$, with $b = 1, 2, 3, 4$. What is the time interval between successive maxima of the oscillation?
- For each function in part (a), what is the frequency of the oscillation (i) measured in cycles per unit of time and (ii) measured in units of cycles per 2π units of time?
- In the general solution, let $b = 2$, $c_1 = 2$, and $c_2 = 0$. Graph the solution on the interval $0 \leq t \leq 2\pi$, with $a = -0.1, -0.5, -1, -1.5, -2$. In each case, how long does it take for the amplitude of the oscillation to decay to 1/3 of its initial value?
- Graph the solution $y = e^{-t/2}(2 \cos 2t - \sin 2t)$. What is the time interval between successive maxima of the oscillation? Roughly how long does it take for the amplitude of the oscillation to decay to 1/3 of its initial value?

61. Buckling column A model of the buckling of an elastic column involves the fourth-order equation $y^{(4)}(x) + k^2 y''(x) = 0$, where k is a positive real number. Find the general solution of this equation.

Additional Exercises

62. Cauchy-Euler equation with repeated roots One of several ways to find the second linearly independent solution of a Cauchy-Euler equation

$$t^2 y''(t) + aty'(t) + by(t) = 0, \quad \text{for } t > 0$$

in the case of a repeated real root is to change variables.

- What is the polynomial associated with this equation?
- Show that if we let $t = e^x$ (or $x = \ln t$), then this equation becomes the constant coefficient equation

$$y''(x) + (a - 1)y'(x) + by(x) = 0.$$

- What is the characteristic polynomial for the equation in part (b)? Conclude that if the polynomial in part (a) has a repeated root, then the characteristic polynomial also has a repeated root.
- Write the general solution of the equation in part (b) in the case of a repeated root.
- Express the solution in part (d) in terms of the original variable t to show that the second linearly independent solution of the Cauchy-Euler equation is $y = t^{(1-a)/2} \ln t$.

63. Cauchy-Euler equation with repeated roots again Here is another instructive calculation that leads to the second linearly independent solution of a Cauchy-Euler equation in the case of a repeated root. Assume the equation has the form $t^2y'' + aty' + by = 0$, for $t > 0$, and that the corresponding polynomial has a repeated root.

- Show that the repeated root is $p = \frac{1-a}{2}$, which implies that $2p + a = 1$.
- Assume the second solution has the form $y(t) = t^p v(t)$, where the function v must be determined. Substitute the solution in this form into the equation. After simplification and using part (a), show that v satisfies the equation $t^2v'' + tv' = 0$.
- This equation is first order in v' , so let $w = v'$ and solve for w to find that $w = \frac{c_1}{t}$, where c_1 is an arbitrary constant of integration.
- Now solve the equation $v' = w = \frac{c_1}{t}$ for v and show that $y(t) = t^p v(t)$ is the complete general solution (with two linearly independent solutions).

64. Cauchy-Euler equation with complex roots To find the general solution of a Cauchy-Euler equation

$$t^2y''(t) + aty'(t) + by(t) = 0, \quad \text{for } t > 0$$

in the case of complex roots, we change variables as in Exercise 62.

- Show that with $t = e^x$ (or $x = \ln t$), the original differential equation can be written

$$y''(x) + (a-1)y'(x) + by(x) = 0.$$

- Solve this constant-coefficient equation in the case of complex roots. Then express the solution in terms of t to show that the general solution of the Cauchy-Euler equation is $y = c_1 t^\alpha \cos(\beta \ln t) + c_2 t^\alpha \sin(\beta \ln t)$, where $\alpha = \frac{1-a}{2}$ and $\beta = \frac{1}{2}\sqrt{4b - (a-1)^2}$.

65. Finding the second solution Consider the constant-coefficient equation $y'' + py' + qy = 0$ in the case that the characteristic polynomial has two distinct real roots r_1 and r_2 . The general solution is $y = c_1 e^{r_1 t} + c_2 e^{r_2 t}$.

- Explain why $u = \frac{e^{r_1 t} - e^{r_2 t}}{r_1 - r_2}$ is a solution of the equation.
- Now consider t and r_2 fixed and let $r_1 \rightarrow r_2$ in order to investigate what happens as the distinct roots become a repeated root. Evaluate $\lim_{r_1 \rightarrow r_2} u$ and identify both linearly independent solutions in the repeated root case.

66. Finding the second solution again Consider the constant-coefficient equation $y'' + py' + qy = 0$ in the case that the characteristic polynomial has a repeated root, which we call r . Here is another way to find the second linearly independent solution. Because $y = e^{rt}$ is a solution, we write

$$(e^{rt})'' + p(e^{rt})' + q(e^{rt}) = 0.$$

We now differentiate both sides of this equation with respect to r , assuming that the order of differentiation with respect to t and r may be interchanged. Show that the result is the equation

$$(te^{rt})'' + p(te^{rt})' + q(te^{rt}) = 0,$$

which implies that $y = te^{rt}$ is also a solution.

QUICK CHECK ANSWERS

- If $y = e^{rt}$, then $y' = re^{rt} = ry$ and $y'' = r^2 e^{rt} = r^2 y$.
- $r^2 - 1 = 0$; roots $r = \pm 1$
- $r^2 + 2r + 1 = 0$; solutions $\{e^{-t}, te^{-t}\}$
- $r^2 + 1 = 0$; roots $r = \pm i$
- $p^2 - 1 = 0$; roots $p = \pm 1$. ◀

D2.3 Linear Nonhomogeneous Equations

The homogeneous equations discussed in the previous section are used to model mechanical and electrical oscillators in the *absence* of external forces. Equally important are oscillators that are driven by external forces (such as an imposed load or a voltage source). When external forces are included in a differential equations model, the result is a nonhomogeneous equation, which is the subject of this section.

Solutions of a homogeneous oscillator equation are often called *free oscillations*. They represent the natural response of a system to an initial displacement or velocity—as specified by the initial conditions. For example, suppose a block on a spring is pulled away from its equilibrium position and then released. If no external forces act on the system, the motion of the block is determined by the initial conditions, the restoring force of the spring (which depends on the displacement of the block), and possibly friction (which often depends on the velocity of the block). In this case, we observe the system responding without outside influences.

If an external force is present, then the resulting response of the system is called a *forced oscillation*; it is a combination of the natural response and the effects of the force. In order to understand forced oscillations, we must know solutions of the nonhomogeneous equation (forces present) *and* solutions of the homogeneous equation (forces absent).

Particular Solutions

We now consider second-order equations of the form

$$y''(t) + py'(t) + qy(t) = f(t),$$

where p and q are constants, and f is a specified function that is not identically zero on the interval of interest. Recall that any solution of this equation is called a **particular solution**, which we denote y_p . As proved in Section D2.1, there are infinitely many particular solutions of a given equation, all differing by a solution of the homogeneous equation. Also shown in Section D2.1 is that if the homogeneous equation

$$y''(t) + py'(t) + qy(t) = 0$$

has the linearly independent solutions y_1 and y_2 , then the general solution of the nonhomogeneous equation is

$$y = \underbrace{c_1 y_1 + c_2 y_2}_{\substack{\text{solution of the} \\ \text{homogeneous} \\ \text{equation}}} + \underbrace{y_p}_{\substack{\text{particular} \\ \text{solution}}},$$

where c_1 and c_2 are arbitrary constants. If initial conditions are given, they are used to determine c_1 and c_2 . So the procedure for solving initial value problems associated with a nonhomogeneous equation consists of the following steps.

PROCEDURE Solving Initial Value Problems

Use the following steps to solve the initial value problem

$$y'' + py' + qy = f(t), y(0) = A, y'(0) = B.$$

1. Find two linearly independent solutions y_1 and y_2 of the homogeneous equation $y'' + py' + qy = 0$.
2. Find any particular solution y_p of the nonhomogeneous equation $y'' + py' + qy = f(t)$.
3. Form the general solution $y = c_1 y_1 + c_2 y_2 + y_p$.
4. Use the initial conditions $y(0) = A$ and $y'(0) = B$ to determine the constants c_1 and c_2 .

We already know how to find solutions of the homogeneous equation, so we now turn to methods for finding particular solutions.

► In forming the general solution of a nonhomogeneous equation, it doesn't matter which of the infinitely many particular solutions you use. Because two particular solutions differ by a solution of the homogeneous equation, the difference between two particular solutions is absorbed in the terms $c_1 y_1 + c_2 y_2$.

Method of Undetermined Coefficients

In theory, the right-side function f could be any continuous or piecewise continuous function. We limit our attention to three families of functions:

- polynomial functions: $f(t) = p_n(t) = a_n t^n + \cdots + a_1 t + a_0$,
- exponential functions: $f(t) = Ae^{at}$, and
- sine and cosine functions: $f(t) = A \cos bt + B \sin bt$.

For the right-side functions listed above, the best method for finding a particular solution is the **method of undetermined coefficients**. Several examples illustrate the method.

EXAMPLE 1 Undetermined coefficients with polynomials Find the general solution of the equation $y'' - 4y = t^2 - 3t + 2$.

SOLUTION We follow the steps given above.

1. The associated homogeneous equation is $y'' - 4y = 0$. Using the methods of Section D2.2, the characteristic polynomial is $r^2 - 4$, which has roots $r = \pm 2$. Therefore, the general solution of the homogeneous equation is $y = c_1 e^{2t} + c_2 e^{-2t}$.
2. A particular solution is a function y_p , which, when added to multiples of its derivatives, equals $t^2 - 3t + 2$. Such a function must be a polynomial; in fact, it is a polynomial of degree two or less. Therefore, we use a trial solution of the form $y_p = At^2 + Bt + C$, where A , B , and C are called *undetermined coefficients* that must be found. We now substitute the trial solution into the left side of the differential equation:

$$\begin{aligned} y_p'' - 4y_p &= \underbrace{(At^2 + Bt + C)''}_{2A} - 4(At^2 + Bt + C) && \text{Substitute.} \\ &= 2A - 4At^2 - 4Bt - 4C && \text{Differentiate.} \\ &= -4At^2 - 4Bt + 2A - 4C. && \text{Collect terms.} \end{aligned}$$

Equating the right and left sides of the differential equation gives the equation

$$-4At^2 - 4Bt + 2A - 4C = t^2 - 3t + 2.$$

In order for this equation to hold for all t , the coefficients of t^2 , t , and 1 on both sides of the equation must be equal. Equating coefficients, we find the following conditions for A , B , and C .

$$\begin{aligned} t^2: \quad & -4A = 1 \\ t: \quad & -4B = -3 \\ 1: \quad & 2A - 4C = 2 \end{aligned}$$

The solution of this set of equations is found to be

$$A = -\frac{1}{4}, B = \frac{3}{4}, \text{ and } C = -\frac{5}{8}.$$

3. We now assemble the general solution of the nonhomogeneous equation; it is

$$y = \underbrace{c_1 e^{2t} + c_2 e^{-2t}}_{\text{solution of the homogeneous equation}} + \underbrace{\left(-\frac{1}{4}t^2 + \frac{3}{4}t - \frac{5}{8}\right)}_{\text{particular solution}}$$

QUICK CHECK 1 What trial solution is used to find the particular solution of the equation $y'' - 2y = 3t + 1$? ◀

Related Exercises 9–12 ◀

EXAMPLE 2 Undetermined coefficients with exponentials Find the general solution of the equation $y'' + y' - 2y = 6e^{3t} - e^{-t}$.

SOLUTION Again, we follow the steps given above.

1. The homogeneous equation $y'' + y' - 2y = 0$ has the characteristic polynomial $r^2 + r - 2$, whose roots are $r = 1$ and $r = -2$. Therefore, the general solution of the homogeneous equation is $y = c_1 e^t + c_2 e^{-2t}$.
2. To find a particular solution, we reason much as we did in Example 1. A particular solution y_p and multiples of its derivatives must add up to $6e^{3t} - e^{-t}$. A trial solution in this case is $y_p = Ae^{3t} + Be^{-t}$, where A and B must be found. We now substitute the trial solution into the differential equation:

$$\begin{aligned}
 y_p'' + y_p' - 2y_p &= \underbrace{(Ae^{3t} + Be^{-t})''}_{9Ae^{3t} + Be^{-t}} + \underbrace{(Ae^{3t} + Be^{-t})'}_{3Ae^{3t} - Be^{-t}} - 2(Ae^{3t} + Be^{-t}) && \text{Substitute.} \\
 &= 9Ae^{3t} + Be^{-t} + (3Ae^{3t} - Be^{-t}) - 2(Ae^{3t} + Be^{-t}) && \text{Differentiate.} \\
 &= e^{3t}(9A + 3A - 2A) + e^{-t}(B - B - 2B) && \text{Collect terms.} \\
 &= 10Ae^{3t} - 2Be^{-t} && \text{Simplify.} \\
 &= 6e^{3t} - e^{-t}. && \text{Equals right side}
 \end{aligned}$$

This calculation results in the equation $10Ae^{3t} - 2Be^{-t} = 6e^{3t} - e^{-t}$, which holds for all t only if coefficients of like terms on both sides of the equation are equal.

$$\begin{aligned}
 e^{3t}: \quad 10A &= 6 \\
 e^{-t}: \quad -2B &= -1
 \end{aligned}$$

In this case, we see that $A = \frac{3}{5}$ and $B = \frac{1}{2}$.

3. The general solution of the nonhomogeneous equation now follows:

$$y = c_1 e^t + c_2 e^{-2t} + \frac{3}{5} e^{3t} + \frac{1}{2} e^{-t}.$$

Related Exercises 13–16 ◀

QUICK CHECK 2 What trial solution should be used to find the particular solution of the equation $y'' - 2y = 4e^{-5t}$? ◀

EXAMPLE 3 Undetermined coefficients with sines and cosines Solve the initial value problem $y'' + 16y = 15 \sin t$, $y(0) = 1$, $y'(0) = 1$.

SOLUTION

1. The homogeneous equation $y'' + 16y = 0$ has the characteristic polynomial $r^2 + 16$, which has roots $r = \pm 4i$. Therefore, the general solution of the homogeneous equation is $y = c_1 \sin 4t + c_2 \cos 4t$.
2. Based on the form of the right-side function, a likely trial solution for the particular solution is $y_p = A \sin t + B \cos t$, where the values of A and B must be determined. Substituting the trial solution into the differential equation gives

$$\begin{aligned}
 y_p'' + 16y_p &= \underbrace{(A \sin t + B \cos t)''}_{-A \sin t - B \cos t} + 16(A \sin t + B \cos t) && \text{Substitute.} \\
 &= -A \sin t - B \cos t + 16(A \sin t + B \cos t) && \text{Differentiate.} \\
 &= 15A \sin t + 15B \cos t && \text{Collect terms.} \\
 &= 15 \sin t. && \text{Equals } f(t).
 \end{aligned}$$

The condition $15A \sin t + 15B \cos t = 15 \sin t$, which must hold for all t , is satisfied provided $A = 1$ and $B = 0$.

3. It follows that the general solution of the nonhomogeneous equation is

$$y = c_1 \sin 4t + c_2 \cos 4t + \sin t.$$

FIGURE D2.13

4. In this example, we are given initial conditions, which are used to determine the constants c_1 and c_2 . First notice that $y'(t) = 4c_1 \cos 4t - 4c_2 \sin 4t + \cos t$. The initial conditions now imply that

$$y(0) = c_2 = 1 \quad \text{and} \quad y'(0) = 4c_1 + 1 = 1, \text{ or } c_1 = 0.$$

Therefore, the solution of the initial value problem is

$$y = \cos 4t + \sin t.$$

The solution of the initial value problem (red curve in Figure D2.13) is instructive. It contains one term from the solution of the homogeneous equation, representing the natural response of the system, and one term from the particular solution, representing the effect of the external force. The resulting response is a high-frequency wave $y = \cos 4t$ superimposed on a low-frequency wave $y = \sin t$ (dashed curve in Figure D2.13).

The calculation that led to the solution also has a useful lesson. The trial solution has a term ($B \cos t$) that does not appear in the particular solution. The method of undetermined coefficients will always return a value of zero for the coefficient of an unnecessary term. So it is better to err on the side of including too many terms in the trial solution.

Related Exercises 17–20 ◀

QUICK CHECK 3 What trial solution should be used to find the particular solution of the equation $y'' - 2y = \cos 5t - 3 \sin 5t$? ◀

EXAMPLE 4 Undetermined coefficients with combined functions Find the general solution of the equation

$$y'' + 6y' + 25y = 29e^{-t} \sin t.$$

SOLUTION

1. The characteristic polynomial of the homogeneous equation is $r^2 + 6r + 25 = 0$, whose roots are $r = -3 \pm 4i$. Therefore, the general solution of the homogeneous equation is

$$y = c_1 e^{-3t} \sin 4t + c_2 e^{-3t} \cos 4t.$$

2. To find a particular solution, we surmise that a term of the form $e^{at} \sin bt$ or $e^{at} \cos bt$ on the right side of the equation requires a trial solution of the form $y_p = Ae^{at} \sin bt + Be^{at} \cos bt$. For this particular problem, we let $a = -1$ and $b = 1$. Differentiating and collecting terms, we find that

$$\begin{aligned} y_p' &= -(A + B)e^{-t} \sin t + (A - B)e^{-t} \cos t \quad \text{and} \\ y_p'' &= 2Be^{-t} \sin t - 2Ae^{-t} \cos t. \end{aligned}$$

When the derivatives are substituted into the differential equation and simplifications are made, the result is the equation

$$(19A - 4B)e^{-t} \sin t + (4A + 19B)e^{-t} \cos t = 29e^{-t} \sin t.$$

We now equate coefficients of $e^{-t} \sin t$ and $e^{-t} \cos t$ on both sides of the equation to give the conditions on A and B :

$$\begin{aligned} 19A - 4B &= 29 \\ 4A + 19B &= 0. \end{aligned}$$

A short calculation gives the values $A = \frac{19}{13}$ and $B = -\frac{4}{13}$.

Therefore, a particular solution is

$$y_p = \frac{19}{13} e^{-t} \sin t - \frac{4}{13} e^{-t} \cos t.$$

3. Combining the solution of the homogeneous equation and the particular solution, the general solution of the equation is

$$y = c_1 e^{-3t} \sin 4t + c_2 e^{-3t} \cos 4t + \frac{19}{13} e^{-t} \sin t - \frac{4}{13} e^{-t} \cos t.$$

Taking $c_1 = c_2 = 0$, we see that the particular solution (Figure D2.14) is a rapidly damped wave.

FIGURE D2.14

Related Exercises 21–28 ◀

QUICK CHECK 4 What trial solution should be used to find the particular solution of the equation $y'' - 2y = 13e^{-2t} \cos 7t$? ◀

The four preceding examples demonstrate how the method of undetermined coefficients works. By now, you probably realize that if you choose an appropriate trial solution, then the method eventually produces a particular solution of an equation, although some persistence may be needed. Therefore, the crux of the method is choosing a good trial solution. Table D2.2 lists the trial solutions needed for commonly occurring right-side functions. In this table, lower case letters represent coefficients that are given, upper case letters are undetermined coefficients that must be found, and p_n is an n th-degree polynomial

$$p_n(t) = a_n t^n + \cdots + a_1 t + a_0, \text{ where } a_n \neq 0.$$

Table D2.2 Trial Solutions—Almost Always

Right-side function f includes ...	Trial solution
$p_n(t)$	$A_n t^n + \cdots + A_1 t + A_0$
e^{at}	Ae^{at}
$\sin bt$ or $\cos bt$	$A \sin bt + B \cos bt$
$p_n(t)e^{at}$	$(A_n t^n + \cdots + A_1 t + A_0)e^{at}$
$p_n(t) \sin bt$ or $p_n(t) \cos bt$	$(A_n t^n + \cdots + A_1 t + A_0) \sin bt + (B_n t^n + \cdots + B_1 t + B_0) \cos bt$
$e^{at} \sin bt$ or $e^{at} \cos bt$	$Ae^{at} \sin bt + Be^{at} \cos bt$

If a right-side function is a sum of two or more functions (say, $f = f_1 + f_2$), a particular solution must be found for each function in the sum. Then the particular solution for f is the sum of the particular solutions for f_1 and f_2 (Exercise 51).

The Exceptions

The trial solutions in Table D2.2 almost always work; however, there are a few exceptions. If the exceptions were insignificant, they might be overlooked. As we show in the next section, the exceptions correspond to an important physical phenomenon, so it's necessary to investigate these special cases.

To find the general solution of the equation

$$y'' + 9y = 4 \sin 3t,$$

we proceed as in previous examples. The characteristic polynomial of the homogeneous equation is $r^2 + 9$, which has roots $r = \pm 3i$. Therefore, the general solution of the homogeneous equation is

$$y = c_1 \sin 3t + c_2 \cos 3t.$$

To find the particular solution, we follow Table D2.2 and use the trial solution $y_p = A \sin 3t + B \cos 3t$. Substituting this solution into the differential equation leads to

$$\begin{aligned} y_p'' + 9y_p &= \underbrace{(A \sin 3t + B \cos 3t)''}_{-9A \sin 3t - 9B \cos 3t} + 9(A \sin 3t + B \cos 3t) && \text{Substitute.} \\ &= -9A \sin 3t - 9B \cos 3t + 9A \sin 3t + 9B \cos 3t && \text{Differentiate.} \\ &= \underbrace{(-9A + 9A)}_0 \sin 3t + \underbrace{(-9B + 9B)}_0 \cos 3t && \text{Simplify.} \\ &\neq 4 \sin 3t, \quad \text{for all } t. \end{aligned}$$

Ordinarily, at this stage of the calculation, we would match coefficients of $\sin 3t$ and $\cos 3t$ on both sides of the equation, and solve for A and B . However, in this case, we find that $y_p'' + 9y_p = 0$, which means the trial solution failed. The failure occurred because a solution of the homogeneous equation appears on the right side of the equation.

Before explaining the remedy for this special case, let's see what it means physically. Recall that solutions of the homogeneous equation represent the natural response of the system in the absence of external forces. When an external force is applied to a system that matches the natural response of the system, something unusual happens. As we discuss in the next section, this occurrence is called *resonance*.

When a solution of the homogeneous equation appears on the right side of the equation, the trial solution must be adjusted slightly. The adjusted trial solution is the trial solution given in Table D2.2 multiplied by t^s , where $s = 1$ or $s = 2$ is chosen to ensure that no term in the trial solution is a solution of the homogeneous equation (Exercise 52).

Table D2.2 may be revised and presented concisely as follows.

SUMMARY Trial Solutions for $y'' + py' + qy = f$

To find the particular solution of the equation

$$y'' + py' + qy = p_n(t)e^{at} \cdot \begin{cases} \sin bt \\ \cos bt \end{cases}$$

use the trial solution given in Table D2.2 multiplied by t^s , where s is the smallest nonnegative integer that ensures that no term of y_p is a homogeneous solution.

EXAMPLE 5 Special cases Find the general solution of the equation

$$y'' + 9y = 4 \sin 3t.$$

SOLUTION We notice that the right-side function $4 \sin 3t$ is a solution of the homogeneous equation. Therefore, we modify the standard trial solution $y_p = A \sin 3t + B \cos 3t$ and instead use

$$y_p = At \sin 3t + Bt \cos 3t.$$

Substituting into the differential equation, we see that

$$\begin{aligned} y_p'' + 9y_p &= (At \sin 3t + Bt \cos 3t)'' + 9(At \sin 3t + Bt \cos 3t) && \text{Substitute.} \\ &= A(6 \cos 3t - 9t \sin 3t) + B(-6 \sin 3t - 9t \cos 3t) \end{aligned}$$

$$\begin{aligned} &\quad \quad \quad \underbrace{\hspace{10em}}_{y_p''} \\ &\quad \quad \quad + 9At \sin 3t + 9Bt \cos 3t && \text{Differentiate.} \end{aligned}$$

$$\begin{aligned} &= -6B \sin 3t + 6A \cos 3t \\ &\quad \quad \quad - \underbrace{(9A - 9A)t \sin 3t}_0 - \underbrace{(9B - 9B)t \cos 3t}_0 && \text{Simplify.} \end{aligned}$$

$$\begin{aligned} &= -6B \sin 3t + 6A \cos 3t && \text{Simplify.} \\ &= 4 \sin 3t. && \text{Equals right side} \end{aligned}$$

Notice the cancellation of terms leaves us with a linear combination of $\sin 3t$ and $\cos 3t$. We now use the equation $-6B \sin 3t + 6A \cos 3t = 4 \sin 3t$ and match coefficients of $\sin 3t$ and $\cos 3t$. We conclude that $A = 0$ and $B = -\frac{2}{3}$. Therefore, the particular solution

is $y_p = -\frac{2}{3}t \cos 3t$, and the general solution of the equation is

$$y = c_1 \sin 3t + c_2 \cos 3t - \frac{2}{3}t \cos 3t.$$

Figure D2.15 shows the particular solution ($c_1 = c_2 = 0$) and its significant property: Because of the multiplicative factor of t in the solution, the amplitude of this oscillation increases linearly with t . The solution is wrapped in an envelope formed by two lines with slopes $\pm \frac{2}{3}$.

FIGURE D2.15

QUICK CHECK 5 What trial solution should be used to find the particular solution of the equation $y'' - 4y = 6e^{2t}$? ◀

Related Exercises 29–34 ◀

In closing, we mention one remaining case that hasn't been discussed. Consider the equation $y'' + 4y' + 4y = 3e^{-2t}$. You can check that the characteristic polynomial for the homogeneous equation is $r^2 + 4r + 4 = (r + 2)^2$. Therefore, the characteristic polynomial has the repeated root $r = -2$ and the solution of the homogeneous equation (by Section D2.2) is $y = c_1 e^{-2t} + c_2 t e^{-2t}$. Now when we look for a particular solution, we see that a solution of the homogeneous equation appears on the right side of the equation. The trial solution cannot be $y_p = A e^{-2t}$ or $y_p = A t e^{-2t}$, because both of these functions are solutions of the homogeneous equation. In this case, the correct trial solution is $y_p = A t^2 e^{-2t}$.

SECTION D2.3 EXERCISES

Review Questions

1. Explain how to find the general solution of the nonhomogeneous equation $y'' + py' + qy = f(t)$, where p and q are constants.
2. What trial solution would you use to find a particular solution of the equation $y'' + py' + qy = t^3 - t + 1$, where p and q are constants?
3. What trial solution would you use to find a particular solution of the equation $y'' - 8y = 2e^{-4t}$?
4. What trial solution would you use to find a particular solution of the equation $y'' - 2y = 2 \sin 3t$?
5. What trial solution would you use to find a particular solution of the equation $y'' - 2y = 6e^{-t} \cos 4t$?
6. What trial solution would you use to find a particular solution of the equation $y'' - 2y = 1 + t + \cos 3t$?
7. What trial solution would you use to find a particular solution of the equation $y'' - 4y = t^2 e^{-t}$?
8. What trial solution would you use to find a particular solution of the equation $y'' - 4y' + 4y = 6e^{2t}$?

Basic Skills

9–12. Undetermined coefficients with polynomials Find a particular solution of the following equations.

9. $y'' - 9y = 2t + 1$
10. $y'' - 2y' - 15y = 3t^3 - 2t - 4$
11. $y'' + 3y' - 18y = 2t^4 - t^2$
12. $y'' + 5y = 6t^3 - t^2$

13–16. Undetermined coefficients with exponentials Find a particular solution of the following equations.

13. $y'' - y = e^{-2t}$
14. $y'' + 3y = 5e^{-3t}$
15. $y'' - 4y' - 32y = 6e^{-3t}$
16. $y'' + 2y' - 8y = e^{-t} - 2e^t$

17–20. Undetermined coefficients with sines/cosines Find a particular solution of the following equations.

17. $y'' - y = 3 \sin 2t$
18. $y'' + 4y = 5 \cos 3t$
19. $y'' - y' - 6y = \sin t + 3 \cos t$
20. $y'' - 3y' - 4y = 2 \cos 2t - 3 \sin 2t$

21–28. Undetermined coefficients with combined functions Find a particular solution of the following equations.

21. $y'' - 4y = 2e^t - 1$
22. $y'' + y = \cos 2t + t^3$
23. $y'' + y' - 12y = 2te^{-t}$

24. $y'' + 4y = e^{-t} \cos t$
25. $y'' + 16y = t \cos 2t$
26. $y'' - 9y = (t^2 + 1)e^{-t}$
27. $y'' - y' - 2y = t(\cos t - \sin t)$
28. $y'' + 2y' - 4y = t^2 \cos t$

29–34. Undetermined coefficients with special cases Find a particular solution of the following equations.

29. $y'' - y = 3e^t$
30. $y'' + y = 3 \cos t$
31. $y'' + y' - 6y = 4e^{-3t}$
32. $y'' + 4y = \cos 2t$
33. $y'' + 5y' + 6y = 2e^{-2t}$
34. $y'' + 2y' + y = 4e^{-t}$

Further Explorations

35. Explain why or why not Determine whether the following statements are true and give an explanation or counterexample.

- a. To find a particular solution of the equation $y'' - 4y = t^3$, you should use the trial solution $y_p = At^3$.
- b. To find a particular solution of the equation $y'' + y' - 6y = \sin t$, you should use the trial solution $y_p = A \sin t$.
- c. To find a particular solution of the equation $y'' + 10y' + 25y = e^{5t}$, you should use the trial solution $y_p = Ae^{5t}$.

36–41. Initial value problems Find the general solution of the following equations and then solve the given initial value problem.

36. $y'' - 9y = 2e^{-t}$, $y(0) = 0$, $y'(0) = 0$
37. $y'' + y = 4 \sin 2t$, $y(0) = 1$, $y'(0) = 0$
38. $y'' + 3y' + 2y = 2e^{-3t}$, $y(0) = 0$, $y'(0) = 1$
39. $y'' + 4y' + 5y = 12$, $y(0) = 1$, $y'(0) = -1$
40. $y'' - y = 2e^{-t} \sin t$, $y(0) = 4$, $y'(0) = 0$
41. $y'' + 9y = 6 \cos 3t$, $y(0) = 0$, $y'(0) = 0$

42–45. Longer calculations Find a particular solution of the following equations.

42. $y'' + 2y' + 2y = 5e^{-2t} \cos t$
43. $y'' + y' - y = 3t^4 - 3t^3 + t$
44. $y'' + 2y' + 5y = 8e^{-t} \cos 2t$
45. $y'' - y = 25te^{-t} \sin 3t$

46–49. Higher-order equations The method of undetermined coefficients extends naturally to higher-order constant coefficient equations. Find a particular solution of the following equations.

46. $y''' - y' = 8t^3$
47. $y''' - 8y = 7e^t$

48. $y^{(4)} - y = 5 \sin 2t$
 49. $y^{(4)} - 3y'' + 2y = 6te^{2t}$

Applications

Applications of Sections D2.2 and D2.3 are considered in Section D2.4.

- 50. Looking ahead: beats** One of the applications considered in Section D2.4 results in the initial value problem

$$y'' + \omega_0^2 y = a \cos \omega t, y(0) = 0, y'(0) = 0,$$

where a , ω , and ω_0 are positive real numbers.

- a. Assume that $\omega \neq \omega_0$ and find the general solution of this equation.
 b. Solve the initial value problem and show that the solution is

$$y = \frac{a}{\omega_0^2 - \omega^2} (\cos \omega t - \cos \omega_0 t).$$

- c. The case in which ω and ω_0 are nearly equal is of interest. Let $\omega = 5$ and $\omega_0 = 6$ and graph the solution on $[0, 6\pi]$. Describe the solution you see.
 d. In order to identify the frequencies in the solution, use the identity

$$\cos \omega t - \cos \omega_0 t = 2 \sin \frac{(\omega_0 - \omega)t}{2} \sin \frac{(\omega_0 + \omega)t}{2}$$

to rewrite the solution in terms of a product of two sine functions.

- e. Now interpret the graph of part (c) and identify the two frequencies in the solution.

Additional Exercises

- 51. Sum of particular solutions** Show that a particular solution of the equation $y'' + py' + qy = f(t) + g(t)$ is $y_{p1} + y_{p2}$, where y_{p1} is a particular solution of $y'' + py' + qy = f(t)$ and y_{p2} is a particular solution of $y'' + py' + qy = g(t)$.

- 52. Variation of parameters** Finding a particular solution when a homogeneous solution appears in the right-side function is handled using a method called *variation of parameters*. (This method is also used to find particular solutions of equations that cannot be handled by undetermined coefficients.) The following steps show how variation of parameters is used to find the particular solution of one specific equation.

- a. Consider the equation $y'' - y = e^t$. Show that the homogeneous solutions are $y_1 = e^t$ and $y_2 = e^{-t}$. Note that the right-side function is a homogeneous solution.
 b. Assume a particular solution has the form

$$y_p(t) = u_1(t)y_1(t) + u_2(t)y_2(t) = u_1(t)e^t + u_2(t)e^{-t},$$

where the functions u_1 and u_2 are to be determined. Compute y_p' and impose the condition $u_1'e^t + u_2'e^{-t} = 0$ to show that $y_p' = u_1e^t - u_2e^{-t}$.

- c. Compute y_p'' and substitute it into the differential equation. After canceling several terms, show that the equation reduces to $u_1'e^t - u_2'e^{-t} = e^t$.
 d. Parts (c) and (d) give two equations for u_1' and u_2' . Eliminate u_2' and show that the equation for u_1 is $u_1' = \frac{1}{2}$.

- e. Solve the equation in part (d) for u_1 .

- f. Use part (e) to show that the equation for u_2 is $u_2' = -\frac{1}{2}e^{2t}$.

- g. Solve the equation in part (f) for u_2 .

- h. Now assemble the particular solution $y_p(t) = u_1(t)e^t + u_2(t)e^{-t}$ and show that $y_p = \frac{1}{2}te^t - \frac{1}{4}e^t$.

QUICK CHECK ANSWERS

1. $y_p = At + B$ 2. $y_p = Ae^{-5t}$ 3. $y_p = A \sin 5t + B \cos 5t$
 4. $y_p = Ae^{-2t} \sin 7t + Be^{-2t} \cos 7t$ 5. $y_p = Ate^{2t}$ ◀

D2.4 Applications

Throughout this chapter, we have alluded to the many applications of second-order differential equations. We now have the tools needed to formulate and solve some of the second-order differential equations that arise in practical applications.

Mechanical Oscillator Equations

The term *oscillator* is used in several different ways. It may be a block bouncing on a spring, a pendulum on a grandfather clock, a wave on an oscilloscope, or a flowing and ebbing tide. In this section, we consider both mechanical and electrical oscillators, and because mechanical oscillators are easier to visualize, we begin with them. The important fact is that the differential equations that govern various oscillators are similar to one another in many ways.

FIGURE D2.16

The prototype mechanical oscillator is a block on a spring. Whether the spring is oriented vertically or horizontally, the relevant differential equation is the same. Consider the system shown in Figure D2.16 in which a block of mass m is attached to a massless spring that hangs from a rigid support. When the block hangs at rest, the spring is partially stretched and the system is at equilibrium; we denote this position of the block $y = 0$. The positive y -axis points downward in the direction of the gravitational force; that is, positive positions of the block are below the equilibrium position.

At time $t = 0$, the block may be pulled downward or pushed upward to a position y_0 , and it may be given an initial velocity v_0 . Therefore, we have initial conditions of the form $y(0) = y_0$ and $y'(0) = v_0$. Our aim is to formulate a differential equation that describes the position $y(t)$ of the block after it is set in motion at time $t = 0$.

Newton's second law of motion is used to describe the motion of ordinary objects. For one-dimensional motion, it says that

$$\underbrace{\text{mass}}_m \cdot \underbrace{\text{acceleration}}_{a = y''} = \underbrace{\text{sum of forces}}_F$$

or more briefly $my'' = F$, where F may depend on t , y , and y' .

In this section, we consider three forces that could act on the block: the restoring force of the spring, damping (or friction or resistance), and external forces. Let's take them in order.

1. Restoring force: In many situations, the force that the spring exerts on the block is well modeled by Hooke's law—an experimental result that applies when the amount of stretching or compression of the spring is small compared to the overall length of the spring. Suppose that the block attached to the spring has position y . According to Hooke's law, the spring exerts a force on the block that pulls or pushes the block toward the equilibrium position. This restoring force is given by $F_s = -ky$, where $k > 0$ is a constant determined by the stiffness of the spring. Figure D2.17 shows how to interpret Hooke's law. If $y > 0$, then the spring is stretched and $F_s < 0$, which means the force acts upward, pulling the block toward the equilibrium position. If $y < 0$, then the spring is compressed and $F_s > 0$, which means the force acts downward, pushing the block toward the equilibrium position. In either case, the spring works to “restore” the equilibrium.

FIGURE D2.17

► You may wonder why the gravitational force is not included in the equation of motion. The short answer is that the gravitational force acting on the block is mg , which is the weight of the block. When the block hangs statically on the spring, this force stretches the spring to what we have called the equilibrium position ($y = 0$). By measuring the position of the block relative to this equilibrium position, the gravitational force is effectively included in the equation of motion. See Exercise 42 for the detailed analysis. The equation of motion for a horizontal spring-block system is identical to the equation derived here (Exercises 43–46).

► There are many ways to model resistance to motion. Another common assumption is that $F_d = -c(y')^2$, which leads to a nonlinear equation of motion.

2. Damping force: Resistance to the movement of the block can occur in many ways. The medium in which the block moves (perhaps air or oil) may act to resist motion. In some experiments, resistance may be provided by a dashpot (a piston and cylinder) attached to the block. In all these cases, the damping force acts in the direction opposite that of the motion. A common assumption is that the damping force is proportional to the velocity y' . Therefore, we assume this force has the form $F_d = -cy'$, where $c > 0$ measures the strength of the resistance.

3. External forces: Depending on the system being modeled, external forces F_{ext} may arise in various ways. For example, in a vertically suspended spring-block system, the support of the spring may move, perhaps periodically with a specified amplitude and frequency. Whereas the restoring force depends on y and the damping force depends on y' , the external force is constant or depends only on t .

With these three forces, Newton's second law takes the form

$$my'' = F_s + F_d + F_{\text{ext}} = -ky - cy' + F_{\text{ext}}.$$

Each term in this equation has units of force, which we assume is measured in newtons ($1 \text{ N} = 1 \text{ kg m/s}^2$). Therefore, the units of k are N/m or kg/s^2 , and the units of c are kg/s . Dividing through the equation by m and rearranging terms results in a familiar second-order constant-coefficient equation,

$$y'' + \underbrace{\frac{c}{m}}_b y' + \underbrace{\frac{k}{m}}_{\omega_0^2} y = \underbrace{\frac{F_{\text{ext}}(t)}{m}}_f \quad \text{or} \quad y'' + by' + \omega_0^2 y = f(t),$$

where $b = \frac{c}{m}$ and $\omega_0^2 = \frac{k}{m}$.

In the remainder of this section, we look at several versions of this equation. The following terminology helps organize these different cases.

- If the damping force is zero ($c = b = 0$), the motion is said to be **undamped**. Otherwise, the motion is **damped**.
- If no external forces are present ($F_{\text{ext}} = f = 0$), the system has **free oscillations**. Otherwise, the response consists of **forced oscillations**.

With this one equation of motion, there are four different categories of motion, each of which we investigate.

Free Undamped Oscillations

We now examine some of the behavior that is described by the general oscillator equation

$$y'' + by' + \omega_0^2 y = f(t).$$

The easiest place to begin is with free ($f(t) = 0$) and undamped ($b = 0$) motion. This is the idealized case of a block that is given an initial displacement and/or velocity (as specified by the initial conditions) and then allowed to oscillate in the presence of the restoring force only. The equation of motion is simply

$$y'' + \omega_0^2 y = 0, \text{ where } \omega_0^2 = \frac{k}{m}.$$

Equations of this sort were solved in Section D2.2. The characteristic polynomial is $r^2 + \omega_0^2$, which has roots $r = \pm i\omega_0$. The general solution is

$$y = c_1 \sin \omega_0 t + c_2 \cos \omega_0 t.$$

We see that ω_0 plays the role of an angular frequency; in this setting, it is the **natural frequency** of the oscillator. The solution describes a wave with constant amplitude and a period of $2\pi/\omega_0$; it is also an example of **simple harmonic motion**. Recall that a solution of the form $y = c_1 \sin \omega_0 t + c_2 \cos \omega_0 t$ may always be expressed in amplitude-phase form $y = A \sin(\omega_0 t + \varphi)$.

QUICK CHECK 2 Consider the function $y = 2 \sin 4.5t$. What is the period of the oscillation described by the function? How many oscillations does the graph have every 2π time units? How many oscillations does the graph have every time unit? ◀

QUICK CHECK 1 Use the terms *damped*, *undamped* and *free/forced* to categorize the systems described by the following equations. (a) $y'' + 0.5y' + 4.3y = 0$, (b) $y'' + 9.2y = \sin 3t$. ◀

► You can check that the units of ω_0 are s^{-1} , which are the units of frequency. For example, $\omega_0 = 3$ means 3 oscillations per 2π time units, or $3/(2\pi)$ oscillations per time unit. If the angular frequency is ω_0 , then the period is $2\pi/\omega_0$ s.

► See Section D2.2 for a review of the amplitude–phase form of a solution. In this case,

$$A = \sqrt{c_1^2 + c_2^2} \text{ and } \tan \varphi = \frac{c_2}{c_1}.$$

EXAMPLE 1 Free undamped oscillations Suppose a block with mass 0.5 kg is attached to a spring, and the spring stretches 0.5 m to bring the system to equilibrium. The block is then pulled down an additional 0.25 m from its equilibrium position and released with an downward velocity of 0.1 m/s. Find the position of the block, for $t \geq 0$.

SOLUTION The first step is to determine the spring constant k . Recall that the acceleration due to gravity is $g = 9.8 \text{ m/s}^2$. When the block is attached to the spring, it produces a force (equal to its weight) of $mg = (0.5 \text{ kg}) \cdot (9.8 \text{ m/s}^2) = 4.9 \text{ N}$ on the spring. By Hooke's law, this force equals ky , where $y = 0.5 \text{ m}$ is the distance the spring is stretched by the force. Therefore, the spring constant satisfies $0.5k = 4.9$, which implies that $k = 9.8 \text{ N/m}$. It follows that the natural frequency of the oscillator is $\omega_0 = \sqrt{\frac{k}{m}} = \sqrt{\frac{9.8}{0.5}} \approx 4.43 \text{ s}^{-1}$, which corresponds to a period of $2\pi/4.43 \approx 1.42 \text{ s}$.

The equation of motion has the general solution

$$y = c_1 \sin \omega_0 t + c_2 \cos \omega_0 t.$$

We now use the initial conditions to evaluate c_1 and c_2 . Noting that

$$y' = c_1 \omega_0 \cos \omega_0 t - c_2 \omega_0 \sin \omega_0 t$$

and using $\omega_0 = 4.43$, we find that

$$y(0) = c_2 = 0.25 \quad \text{and} \quad y'(0) = c_1 \omega_0 = 0.1 \quad \text{or} \quad c_1 = \frac{0.1}{\omega_0} \approx 0.023.$$

Therefore, the solution of the initial value problem is

$$y = 0.023 \sin 4.43t + 0.25 \cos 4.43t.$$

The solution may also be expressed in amplitude-phase form as

$$y = 0.251 \sin (4.43t + 1.48).$$

When the solution is written in this form, it is clear that the block oscillates with a constant amplitude of approximately 0.25 for all time (Figure D2.18a). Without damping, there is no loss of energy in the system, which is an idealized case.

► Although approximations may have been made in computing coefficients of equations, we will use equality signs when writing equations and solutions.

FIGURE D2.18

The phase-plane graph of the solution (Figure D2.18b) shows clearly that the amplitude of the oscillation varies between approximately ± 0.25 , while the velocity varies between approximately ± 1.1 . The closed curve in the phase plane indicates that the solution is periodic with no change in the amplitude over time.

Related Exercises 7–12 ◀

► Recall that we divided through Newton's second law by the mass to produce an equation in terms of acceleration. Therefore, the external force must also be divided by m .

Forced Undamped Oscillations: Beats

When an external force is included with undamped oscillations, some remarkable new effects appear. We limit our attention to external forces of the form $F_{\text{ext}} = F_0 \cos \omega t$, where the amplitude F_0 and the frequency ω of the force are specified. The resulting nonhomogeneous differential equation is

$$y'' + \omega_0^2 y = \frac{F_0}{m} \cos \omega t.$$

Equations of this sort were considered in Section D2.3. As before, the solution of the homogeneous equation is

$$y = c_1 \sin \omega_0 t + c_2 \cos \omega_0 t.$$

Using undetermined coefficients with the assumption that $\omega \neq \omega_0$, the particular solution (Exercise 38) is

$$y_p = \frac{F_0}{m(\omega_0^2 - \omega^2)} \cos \omega t.$$

Therefore, the general solution for the forced undamped oscillator is

$$y = c_1 \sin \omega_0 t + c_2 \cos \omega_0 t + \frac{F_0}{m(\omega_0^2 - \omega^2)} \cos \omega t.$$

To isolate the effect of the external force, we consider the initial conditions $y(0) = y'(0) = 0$, which implies that $c_1 = 0$ and $c_2 = -\frac{F_0}{m(\omega_0^2 - \omega^2)}$. The solution of the initial value problem becomes

$$y = \frac{F_0}{m(\omega_0^2 - \omega^2)} (\cos \omega t - \cos \omega_0 t),$$

which is the sum of two oscillatory functions with different frequencies.

The solution is easier to visualize when written using a trigonometric identity as (Exercise 39)

$$y = \underbrace{\frac{2F_0}{m(\omega_0^2 - \omega^2)} \sin \frac{(\omega_0 - \omega)t}{2}}_{\text{low-frequency wave}} \underbrace{\sin \frac{(\omega_0 + \omega)t}{2}}_{\text{high-frequency wave}}.$$

This function is striking when $\omega \approx \omega_0$. In this case, $\frac{2F_0}{m(\omega_0^2 - \omega^2)} \sin \frac{(\omega_0 - \omega)t}{2}$ is a low-frequency wave with amplitude $\frac{2F_0}{m(\omega_0^2 - \omega^2)}$ and a (large) period of $\frac{2\pi}{(\omega_0 - \omega)/2}$, while $\sin \frac{(\omega_0 + \omega)t}{2}$ is a high-frequency wave with amplitude 1 and a (small) period of $\frac{2\pi}{(\omega_0 + \omega)/2}$. When these terms appear in a product, the result is a high-frequency *carrier wave* enclosed by low-frequency envelope waves (Figure D2.19), a phenomenon known as **beats**. The effect can be heard when two tuning forks with nearly equal frequencies are struck at the same time. When the phenomenon occurs in electrical circuits, it is called **amplitude modulation**.

FIGURE D2.19

QUICK CHECK 3 If the wave in Figure D2.19 were a sound wave (perhaps generated by two tuning forks), at what times would the sound be loudest? ◀

EXAMPLE 2 Forced undamped oscillations Suppose the spring-block system in Example 1 is attached to a device that moves the support up and down vertically, imparting to the system a force given by $F_{\text{ext}} = \cos \omega t$. Determine the position $y(t)$ of the block, for $t \geq 0$, with forcing frequencies $\omega = 4$ and $\omega = 1$, assuming $y(0) = y'(0) = 0$.

SOLUTION From Example 1, we know that $m = 0.5$ kg, which implies $\frac{2F_0}{m} = 4$; the natural frequency is $\omega_0 \approx 4.43 \text{ s}^{-1}$. Therefore, the solution of the initial value problem is approximately

$$y = \frac{4}{\underbrace{19.6}_{\omega_0^2} - \omega^2} \sin \frac{(4.43 - \omega)t}{2} \sin \frac{(4.43 + \omega)t}{2}.$$

The solutions are shown in Figure D2.20 with $\omega = 4$ and $\omega = 1$. In the first case, the natural frequency is nearly equal to the forcing frequency and we see a pattern of beats. By contrast, when the two frequencies differ significantly, the resulting solution is a less organized superposition of two waves. Notice that beats produce a reinforcement of the two component waves and the amplitude of the oscillation is greater with beats.

FIGURE D2.20

Related Exercises 13–16 ◀

Forced Undamped Oscillations: Resonance

The other interesting situation that arises with forced undamped oscillations occurs when $\omega = \omega_0$; in this case, the frequency of the external force exactly matches the natural frequency. The differential equation becomes

$$y'' + \omega_0^2 y = \frac{F_0}{m} \cos \omega_0 t.$$

We now have the special case discussed in Section D2.3 in which a homogeneous solution appears on the right side of the equation. Recall that to find a particular solution in this case, we use a trial solution of the form $y_p = At \sin \omega_0 t + Bt \cos \omega_0 t$. Carrying out a familiar calculation with undetermined coefficients, we find the particular solution

$$y_p = \frac{F_0}{2m\omega_0} t \sin \omega_0 t.$$

Therefore, the general solution of the equation is

$$y = c_1 \sin \omega_0 t + c_2 \cos \omega_0 t + \frac{F_0}{2m\omega_0} t \sin \omega_0 t.$$

► The catastrophic collapse of the Tacoma Narrows Bridge in 1940 is often attributed to a resonance set up when the frequency of wind gusts matched the natural frequency of the bridge. Careful analysis suggests that the causes of the collapse were more complex and probably involved aerodynamic effects. See YouTube!

FIGURE D2.21

The critical feature of this solution is the term $t \sin \omega_0 t$, which is an oscillatory function with an increasing amplitude (Figure D2.21). This term leads to a phenomenon, known as **resonance**, which cannot persist in actual physical systems. In a realistic system, either the integrity of the system is altered (for example, a shock absorber fails or a bridge collapses) or damping eventually limits the growth of the oscillations.

Related Exercises 13–16 ◀

EXAMPLE 3 Forced undamped oscillations Suppose the spring-block system in Example 1 is attached to a device that moves the support, imparting to the system a force given by $F_{\text{ext}} = \cos \omega t$, where $\omega = \omega_0 = 4.43$ is the natural frequency of the system. Determine the position $y(t)$ of the block, for $t \geq 0$, assuming $y(0) = y'(0) = 0$.

SOLUTION With $F_0 = 1$, $m = 0.5$, and $\omega_0 = 4.43$, the general solution becomes

$$y = c_1 \sin 4.43t + c_2 \cos 4.43t + 0.23t \sin 4.43t.$$

Imposing the initial conditions, a short calculation shows that $c_1 = c_2 = 0$. Therefore, the solution of the initial value problem is

$$y = 0.23t \sin 4.43t.$$

The solution (Figure D2.22a) displays the increasing amplitude associated with resonance. The outward spiral of the phase-plane graph of the solution (Figure D2.22b) also gives a vivid picture of the amplitude growth.

FIGURE D2.22

Related Exercises 13–16 ◀

Free Damped Oscillations

Truly undamped oscillations do not occur in most physical systems because friction or resistance is always present in some form. We now turn to more realistic oscillators in which some type of damping is present. With no external forces, the governing equation is

$$y'' + by' + \omega_0^2 y = 0,$$

where $b = \frac{c}{m} > 0$ measures the strength of the damping and $\omega_0 = \sqrt{\frac{k}{m}}$ is the natural frequency. The characteristic polynomial for this equation is $r^2 + br + \omega_0^2$, which has roots

$$r = \frac{-b \pm \sqrt{b^2 - 4\omega_0^2}}{2}.$$

This problem is intriguing because three cases arise depending on the relative sizes of b (damping) and ω_0 (restoring force).

1. If $b^2 > 4\omega_0^2$, the damping force is dominant, and the roots r_1 and r_2 are real and distinct. Furthermore, notice that because $b > 0$ and $\sqrt{b^2 - 4\omega_0^2} < b$, both roots are negative. Therefore, we expect exponentially decaying solutions of the form

$$y = c_1 e^{r_1 t} + c_2 e^{r_2 t}, \text{ with } r_1 < 0 \text{ and } r_2 < 0.$$

In this situation, often called **overdamping**, the damping is strong enough to suppress oscillations.

2. If $b^2 = 4\omega_0^2$, then the characteristic polynomial has a double root $r_1 = -\frac{b}{2}$. We now have solutions of the form

$$y = c_1 e^{r_1 t} + c_2 t e^{r_1 t}, \text{ with } r_1 < 0.$$

In this case, the system “attempts” to oscillate, but the oscillations quickly decay or don’t occur at all. This borderline case is called **critical damping**.

3. If $b^2 < 4\omega_0^2$, then the characteristic polynomial has complex roots of the form

$$r_{1,2} = -\frac{b}{2} \pm i \frac{\sqrt{4\omega_0^2 - b^2}}{2}.$$

In this situation, the restoring force dominates the damping force. As a result, the solutions are oscillatory with decaying amplitudes. This case is called **underdamping**, and solutions have the form

$$y = e^{-bt/2} (c_1 \sin at + c_2 \cos at), \text{ where } a = \frac{\sqrt{4\omega_0^2 - b^2}}{2}.$$

QUICK CHECK 4 Evaluate $\lim_{t \rightarrow \infty} Ate^{-at}$ with $a > 0$. In the case of critical damping, do solutions always decay as t increases? ◀

EXAMPLE 4 Free damped oscillations Suppose the spring-block system in Example 1 ($\omega_0 = 4.43$) is modeled with damping effects included. Determine the position $y(t)$ of the block, for $t \geq 0$, with the following damping coefficients and initial conditions.

- a. $c = 1, y(0) = 0, y'(0) = 1$
- b. $c = 4.43, y(0) = 0, y'(0) = 3$
- c. $c = 5, y(0) = 0, y'(0) = 5$

SOLUTION

- a. With $c = 1$ and $m = 0.5$, we have $b = \frac{c}{m} = 2$. Recalling that the natural frequency of the oscillator is $\omega_0 = 4.43$, we find that $b^2 - 4\omega_0^2 \approx -74.5 < 0$, and we have the case of underdamping. The roots of the characteristic polynomial are the complex numbers

$$r_1 \approx -1 + i \frac{\sqrt{74.5}}{2} \approx -1 + 4.3i \quad \text{and} \quad r_2 \approx -1 - i \frac{\sqrt{74.5}}{2} \approx -1 - 4.3i,$$

which give the general solution

$$y = e^{-t} (c_1 \sin 4.3t + c_2 \cos 4.3t).$$

Note that

$$y' = -e^{-t} (c_1 \sin 4.3t + c_2 \cos 4.3t) + e^{-t} (4.3c_1 \cos 4.3t - 4.3c_2 \sin 4.3t).$$

Therefore, the initial conditions imply that

$$y(0) = c_2 = 0 \text{ and } y'(0) = 4.3c_1 = 1 \text{ or } c_1 \approx 0.23.$$

► The zeros of a damped oscillatory function are equally spaced. However, we generally do not refer to the *period* of such a function. Some texts use *quasiperiod* to describe the distance between local maxima in this case.

The solution of the initial value problem is $y = 0.23e^{-t} \sin 4.3t$ and its graph (Figure D2.23a) features damped oscillations. After the block has oscillated three times, the amplitude of the oscillation has been reduced by a factor of approximately 20. The inward spiral of the phase-plane graph also illustrates the decaying oscillations (Figure D2.23b).

FIGURE D2.23

- b. With $m = 0.5$ and $c = \omega_0 = 4.43$, we have $b = 2c$, which implies that $b^2 - 4\omega_0^2 = 0$. In this case, we have critical damping. The characteristic polynomial has the single repeated root $r_1 = -\frac{b}{2} = -4.43$. Therefore, the general solution of the equation is $y = c_1 e^{-4.43t} + c_2 t e^{-4.43t}$. Before using the initial conditions we compute

$$y' = -4.43c_1 e^{-4.43t} + c_2 e^{-4.43t}(1 - 4.43t).$$

The initial conditions imply that

$$y(0) = c_1 = 0 \quad \text{and} \quad y'(0) = c_2 = 3.$$

The solution of the initial value problem becomes

$$y = 3t e^{-4.43t}.$$

The solution (Figure D2.24) illustrates the idea of critical damping. If the spring in this system is a shock absorber on a truck, a sudden jolt ($y'(0) = 3$) is quickly damped and the truck returns to its equilibrium position smoothly. Depending on the initial conditions, the object could overshoot the equilibrium position once, but the system does not undergo oscillations.

- c. When the damping constant is increased to $c = 5$, we see another type of behavior. With $m = 0.5$ and $\omega_0 = 4.43$, we have $b = 2c = 10$, which implies that $b^2 - 4\omega_0^2 = 21.5 > 0$. The roots of the characteristic polynomial are

$$r = \frac{-b \pm \sqrt{b^2 - 4\omega_0^2}}{2} \approx -2.68 \text{ and } -7.32,$$

and the general solution is

$$y = c_1 e^{-2.68t} + c_2 e^{-7.32t}.$$

FIGURE D2.24

FIGURE D2.25

The initial conditions lead to the equations

$$\begin{aligned} c_1 + c_2 &= 0 \\ -2.68c_1 - 7.32c_2 &= 5, \end{aligned}$$

which have the solutions $c_1 = 1.08$ and $c_2 = -1.08$. Therefore, the solution of the initial value problem is $y = 1.08e^{-2.68t} - 1.08e^{-7.32t}$. The solution (Figure D2.25) decays quickly, at a rate determined by the least negative root. In this case of overdamping, the resistance dominates the restoring force, and there are no oscillations.

Related Exercises 17–20 ◀

Forced Damped Oscillations

The final case includes all the effects discussed so far: a restoring force, damping, and an external force. Some of the many features exhibited by such models are explored in the exercises. In this section, we focus on the behavior that is common to most problems in this category.

We now consider equations of the form

$$y'' + by' + \omega_0^2 y = F_0 \cos \omega t.$$

The first observation is that as long as $b > 0$ (damped oscillations), the characteristic polynomial always has either negative real roots or complex roots with negative real parts. In either case, the solution of the homogeneous equation consists of terms that decrease in magnitude as t increases. Furthermore, as long as $\omega \neq \omega_0$, the particular solution has the form $A \sin \omega t + B \cos \omega t$. Therefore, the general solution looks like

$$y = \underbrace{c_1 y_1 + c_2 y_2}_{\text{decays as } t \rightarrow \infty} + \underbrace{A \sin \omega t + B \cos \omega t}_{\text{particular solution}}.$$

Because the solution of the homogeneous equation decays as t increases, it is called a **transient solution**. It contains the effects of the initial conditions (that are used to determine c_1 and c_2), but eventually it dies out. What remains as t increases is the **steady-state** particular solution, which is determined by the external force. In general, we see that as $t \rightarrow \infty$, $y(t) \rightarrow y_p(t)$.

Figure D2.26 shows the solution to the initial value problem:

$$y'' + 2y' + 10y = 30 \cos t, \quad y(0) = 20, \quad y'(0) = -10.$$

FIGURE D2.26

The transient solution (dashed blue curve) persists until approximately $t = 5$, at which point the steady-state solution (dashed red curve) with the same frequency as the external force dominates. The solution to the initial value problem (solid curve) is the sum of the transient and steady-state solutions.

Forced damped oscillations occur frequently in electrical circuits, the topic that we now consider.

Electrical Circuits

Our survey of electrical circuits is brief, in part because all the mathematics has been done. As you will see, the differential equations that govern circuits are identical to mechanical oscillator equations. Only a change of terminology is required to complete this beautiful analogy.

A basic electrical circuit that displays a wide variety of behavior is the LCR circuit. As shown in Figure D2.27, the circuit has four components connected in series:

- a voltage source such as a battery or generator with output measured in *volts*,
- an inductor (coil) with an inductance of L *henries*,
- a resistor with a resistance of R *ohms*, and
- a capacitor with a capacitance of C *farads*.

FIGURE D2.27

We assume that initially there is no current flowing in the circuit and no charge on the capacitor. When the switch is closed at $t = 0$, a current $I(t)$, measured in *amperes*, flows through the circuit and a charge $Q(t)$, measured in *coulombs*, builds on the capacitor. The current is the rate of change of the charge; that is,

$$I(t) = \frac{dQ}{dt}.$$

The differential equation that describes the current in the circuit comes directly from Kirchhoff's voltage law: *In a closed circuit, the sum of the voltage drops across the inductor, resistor, and capacitor equals the applied voltage.* Elementary circuit theory also gives the voltage drops across the components.

- An inductor stores energy in a magnetic field and produces a voltage drop of $L \frac{dI}{dt}$.
- A resistor dissipates energy and produces a voltage drop of RI .
- A capacitor stores energy in an electric field and produces a voltage drop of Q/C .

Letting $E(t)$ denote the applied voltage, the equation for the circuit is

$$L \frac{dI}{dt} + RI + \frac{1}{C}Q = E(t). \quad (1)$$

As it stands, this equation involves both the current I and the charge Q . We can proceed in two ways. First, we can use the facts that $Q'(t) = I(t)$ and $Q''(t) = I'(t)$, substitute into equation (1), and write an equation for the charge:

$$LQ'' + RQ' + \frac{1}{C}Q = E(t). \quad (2)$$

Often, the current is of more interest. So we can also differentiate both sides of equation (1) and use $Q'(t) = I(t)$ to give an equation for the current:

$$LI'' + RI' + \frac{1}{C}I = E'(t). \quad (3)$$

We consider both of these equations.

The assumption that initially there is no current flowing in the circuit and no charge on the capacitor means that the initial conditions for equation (2) are $Q(0) = 0$ and $I(0) = Q'(0) = 0$. The initial conditions for equation (3) must specify values of $I(0)$ and $I'(0)$. We already have $I(0) = 0$. To determine the initial value $I'(0)$, we use equation (1) with $t = 0$ to find that

$$LI'(0) + \underbrace{RI(0)}_0 + \underbrace{\frac{1}{C}Q(0)}_0 = E(0),$$

which implies that $I'(0) = \frac{E(0)}{L}$.

Working first with the current equation (3), we divide the equation by L to obtain the initial value problem:

$$I'' + \frac{R}{L}I' + \frac{1}{LC}I = \frac{1}{L}E'(t), \quad I(0) = 0, \quad I'(0) = \frac{E(0)}{L}.$$

Notice that this differential equation is second-order with constant coefficients—just like the mechanical oscillator equation. The remarkable analogy between the two equations is shown in [Table D2.3](#).

Table D2.3

Mechanical oscillator	Electrical circuit
$my'' + cy' + ky = f$	$LI'' + RI' + \frac{1}{C}I = E'$
Analogous terms	
Position y	Current I
Mass m	Inductance L
Damping c	Resistance R
Spring constant k	Reciprocal capacitance $1/C$
External force f	Derivative of voltage source E'

Before solving a specific initial value problem, we can make some observations about the general solution. Letting

$$p = \frac{R}{L}, q = \frac{1}{LC}, \quad \text{and} \quad f(t) = \frac{1}{L}E'(t),$$

the equation appears as

$$I'' + pI' + qI = f(t).$$

The characteristic polynomial is $r^2 + pr + q$, and because $p = \frac{R}{L} > 0$, the characteristic polynomial always has either negative real roots or complex roots with negative real parts (just as in the case of forced damped oscillators). Therefore, the solution of the homogeneous equation is a transient solution that decays in time. The steady-state solution is the particular solution, which depends on the form of the right-side function f .

EXAMPLE 5 LCR circuit with constant voltage A circuit consists of a 1-henry inductor, a 50-ohm resistor, and a $1/7025$ -farad capacitor, connected in series, all driven by a constant 800-volt source. Determine the current in the circuit at all times after the switch is closed.

SOLUTION Let $L = 1$, $R = 50$, $1/C = 7025$, and $E(t) = 800$. Observing that $E'(t) = 0$, the equation becomes

$$I'' + 50I' + 7025I = 0,$$

which is a homogeneous equation. The characteristic polynomial $r^2 + 50r + 7025$ has roots

$$r = \frac{-50 \pm \sqrt{2500 - 4 \cdot 7025}}{2} = -25 \pm 80i.$$

Therefore, the general solution of the equation is

$$I = e^{-25t}(c_1 \sin 80t + c_2 \cos 80t).$$

Notice that this circuit is analogous to an underdamped oscillator. The initial conditions are

$$I(0) = 0 \quad \text{and} \quad I'(0) = \frac{E(0)}{L} = 800.$$

We first compute

$$I'(t) = -25e^{-25t}(c_1 \sin 80t + c_2 \cos 80t) + e^{-25t}(80c_1 \cos 80t - 80c_2 \sin 80t),$$

which implies that $I'(0) = -25c_2 + 80c_1$. The initial conditions give the values of c_1 and c_2 :

$$I(0) = c_2 = 0 \quad \text{and} \quad I'(0) = \underbrace{-25c_2 + 80c_1}_{0} = 800, \quad \text{or} \quad c_1 = 10.$$

We conclude that the solution of the initial value problem is

$$I = 10 e^{-25t} \sin 80t.$$

The graph of the current shows a high frequency wave that is quickly damped (Figure D2.28a). The charge on the capacitor (obtained by integrating the current) shows a few oscillations of a transient response before reaching a steady-state level of about 0.11 C within 0.2 seconds (Figure D2.28b).

FIGURE D2.28

Related Exercises 25–32 ◀

EXAMPLE 6 LCR circuit with oscillatory voltage Consider an LCR circuit with a 1-henry inductor, a 50-ohm resistor, and a $1/2500$ -farad capacitor, driven by a voltage of $E(t) = 1021 \cos 60t$. Determine the charge on the capacitor at all times after the switch is closed.

SOLUTION We now work with the charge equation (2). With $L = 1$, $R = 50$, and $1/C = 2500$, the relevant initial value problem is

$$Q'' + 50Q' + 2500Q = 1021 \cos 60t, \quad Q(0) = Q'(0) = 0.$$

The characteristic polynomial is $r^2 + 50r + 2500$, which has roots

$$r = \frac{-50 \pm \sqrt{2500 - 4 \cdot 2500}}{2} = -25 \pm 25\sqrt{3}i.$$

The solution of the homogeneous equation consists of oscillatory functions with decreasing amplitudes:

$$Q_h = e^{-25t}(c_1 \sin 25\sqrt{3}t + c_2 \cos 25\sqrt{3}t).$$

To find the particular solution using undetermined coefficients, the appropriate trial solution (determined by the right-side function) is

$$Q_p = A \sin 60t + B \cos 60t.$$

Substituting the trial solution and carrying out the necessary calculations, we find that

$A = \frac{3}{10}$ and $B = -\frac{11}{100}$. Therefore, the general solution of the equation is

$$Q = e^{-25t}(c_1 \sin 25\sqrt{3}t + c_2 \cos 25\sqrt{3}t) + \frac{3}{10} \sin 60t - \frac{11}{100} \cos 60t.$$

Finally, we impose the initial conditions $Q(0) = Q'(0) = 0$. After more calculations (greatly assisted by a computer algebra system), the solution of the initial value problem emerges:

$$Q = e^{-25t} \left(-\frac{61}{100\sqrt{3}} \sin 25\sqrt{3}t + \frac{11}{100} \cos 25\sqrt{3}t \right) + \frac{3}{10} \sin 60t - \frac{11}{100} \cos 60t.$$

Far more informative is the graph of the charge, shown in [Figure D2.29a](#). The transient part of the solution has an angular frequency of $\omega = 25\sqrt{3}$, but it is quickly damped. The steady-state solution with constant amplitude and an angular frequency of $\omega = 60$ (period $2\pi/60 \approx 0.1$) is all that remains for $t > 0.1$. Similarly, the current $I(t) = Q'(t)$ shows a brief transient solution followed by the steady-state solution with constant amplitude and frequency $\omega = 60$ ([Figure D2.29b](#)). We see that the presence of a variable voltage maintains an oscillatory current in the circuit and charge on the capacitor.

SECTION D2.4 EXERCISES

Review Questions

1. Explain the meaning of the words *damped*, *undamped*, *free*, and *forced* as they apply to an oscillator system.
2. In the models discussed in this section, under what conditions do damped oscillations occur?
3. In the models discussed in this section, under what conditions do beats occur?
4. In the models discussed in this section, under what conditions does resonance occur?
5. Explain the steps required to solve an initial value problem for forced damped oscillations.
6. Describe the analogies between a model for a forced damped oscillator and a model for an LCR circuit.

Basic Skills

7–12. Free undamped oscillations Solve the initial value problem associated with the following experiments.

7. A 1-kg block hangs on a spring with spring constant $k = 1.44$ N/m. The block is pulled down 0.75 m and released with no initial velocity. Assuming no resistance or external forcing, find the position of the block at all times after it is released. Graph and describe the motion of the block, and give its period of oscillation.
8. A 1.5-kg block hangs on a spring with spring constant $k = 3.375$ N/m. The block is pulled down 0.25 m and released with an upward velocity of 0.2 m/s. Assuming no resistance or external forcing, find the position of the block at all times after it is released. Graph and describe the motion of the block, and give its period of oscillation.
9. When a 2-kg block is attached to a spring, it stretches the spring 2.45 m. The block is lifted 0.3 m above its equilibrium position and released with no initial velocity. Assuming no resistance or external forcing, find the position of the block at all times after it is released. Graph and describe the motion of the block, and give its period of oscillation.
10. A 0.5-kg block hangs on a spring and stretches the spring 0.49 m. The block is pulled down 0.6 m and released with a downward velocity of 0.25 m/s. Assuming no resistance or external forcing, find the position of the block at all times after it is released. Graph and describe the motion of the block, and give its period of oscillation.

11. Consider a pendulum consisting of a bob attached by a massless rigid rod to a frictionless pivot that swings in a plane. Assuming no resistance or external forcing, the angular displacement of the pendulum may be approximated by the equation $\theta'' + \omega_0^2 \theta = 0$, where $\omega_0^2 = \frac{g}{\ell}$, ℓ is the length of the rod, and $g = 9.8 \text{ m/s}^2$ is the

acceleration due to gravity (see Exercise 47). Assume a pendulum of length $\ell = 0.98 \text{ m}$ is lifted 0.2 radian from its vertical equilibrium position and released with no initial velocity. Find the angular displacement of the pendulum at all times after it is released. Graph and describe the motion of the bob, and give its period of oscillation.

12. Referring to Exercises 11 and 47, consider a pendulum of length $\ell = 0.49 \text{ m}$ that is lifted 0.25 radian from its vertical equilibrium position and released with an initial velocity of $\theta'(0) = 0.1 \text{ rad/s}$. Find the angular displacement of the pendulum at all times after it is released. Graph and describe the motion of the bob, and give its period of oscillation.

T 13–16. Forced undamped oscillations Solve the initial value problem associated with the following experiments.

13. A 2-kg block hangs on a spring with spring constant $k = 5.12 \text{ N/m}$. The support of the spring vibrates and produces an external force of $F_{\text{ext}} = 4 \cos \omega t$. Assume no initial displacement and velocity of the block, and no damping. Graph the solution in two cases: $\omega = 1.5$ and $\omega = 4$. In which case does the solution have beats?
14. A 0.5-kg block hangs on a spring with spring constant $k = 4.5 \text{ N/m}$. The support of the spring vibrates and produces an external force of $F_{\text{ext}} = 2 \cos \omega t$. Assume no initial displacement and velocity of the block, and no damping. Graph the solution in two cases: $\omega = 3.1$ and $\omega = 0.5$. In which case does the solution have beats?
15. A 0.25-kg block hangs on a spring with spring constant $k = 4.0 \text{ N/m}$. The support of the spring vibrates and produces an external force of $F_{\text{ext}} = \sin \omega t$. Assume no initial displacement and velocity of the block, and no damping. Graph the solution in two cases: $\omega = 4$ and $\omega = 1$. In which case does the solution have resonance?
16. A $4/3$ -kg block hangs on a spring with spring constant $k = 12.0 \text{ N/m}$. The support of the spring vibrates and produces an external force of $F_{\text{ext}} = 9 \cos \omega t$. Assume no initial displacement and velocity of the block, and no damping. Graph the solution in two cases: $\omega = 3$ and $\omega = 0.5$. In which case does the solution have resonance?

T 17–18. Free damped oscillations Solve the initial value problem associated with the following experiments.

17. A 0.3-kg block hangs on a spring with spring constant $k = 30 \text{ N/m}$. Air resistance slows the motion of the block with a damping coefficient of $c \text{ kg/s}$. Solve an initial value problem with the following values of c and initial conditions $y(0) = 1, y'(0) = 0$. Graph each solution and state whether the problem exhibits underdamping, overdamping, or critical damping.
- a. $c = 4.8 \text{ kg/s}$ b. $c = 6 \text{ kg/s}$ c. $c = 7.5 \text{ kg/s}$
18. Three 10-kg blocks hang on springs with spring constant k . Friction in each system is modeled with a damping coefficient of

$c = 40 \text{ kg/s}$. Solve an initial value problem with the following values of k and initial conditions $y(0) = 2, y'(0) = 0$. Graph each solution and state whether the problem exhibits underdamping, overdamping, or critical damping.

- a. $k = 30 \text{ N/m}$ b. $k = 40 \text{ N/m}$ c. $k = 62.5 \text{ N/m}$

T 19. Designing a shock absorber A shock absorber must bear a load of 250 kg (one-fourth the mass of the car). It is estimated that friction in the system can be modeled with a damping constant of $c = 500 \text{ kg/s}$.

- Find the value of the spring constant that provides critical damping for the system.
- Solve the resulting differential equation subject to the initial conditions $y(0) = 0, y'(0) = 0.1$ that model a sudden jolt.
- Graph the solution in part (b). What is the maximum displacement of the car according to this model?
- Determine the effect of increasing the value of k in part (a) by 50% and by 100%.
- What is the effect of decreasing the value of k in part (a) by 50%?

T 20. Designing a suspension system A spring in a suspension system supports a load of 400 kg and has a spring constant $k = 324 \text{ N/m}$. The damping constant c in the system can be varied by embedding the spring in a piston filled with fluid.

- Find the value of the damping constant c that gives the system critical damping.
- Solve the resulting differential equation subject to the initial conditions $y(0) = 0, y'(0) = 0.1$.
- Graph the solution in part (b). What is the maximum displacement of the load according to this model?
- Determine the effect of increasing the damping constant to $c = 720\sqrt{2}$ and decreasing the damping constant to $c = 360\sqrt{3}$ in this model.

T 21–24. Forced damped oscillations

21. A 1-kg block hangs from a spring with spring constant $k = 5 \text{ N/m}$. A dashpot connected to the block introduces friction with damping constant $c = 2 \text{ kg/s}$. The support of the spring vibrates and produces an external force of $F_{\text{ext}} = 4 \cos 2t$. Assume the block is initially at rest at the equilibrium position and released with no initial velocity.
- Find and graph the position of the block after it is released.
 - Identify the transient and steady-state solutions, and graph them with the solution in part (a).
 - After approximately how many seconds does the transient solution become negligible?
22. A 20-kg block hangs from a spring with spring constant $k = 180 \text{ N/m}$. The block oscillates in a fluid that produces resistance with a damping constant $c = 80 \text{ kg/s}$. The support of the spring vibrates and produces an external force of $F_{\text{ext}} = 3 \sin t$. Assume the initial position of the block is one meter above the equilibrium position and it is released with zero initial velocity.
- Find and graph the position of the block after it is released.
 - Identify the transient and steady-state solutions, and graph them separately.
 - After approximately how many seconds does the transient solution become negligible?

23. Consider an oscillator described by the equation

$$y'' + y' + \frac{5}{4}y = 2 \cos \omega t.$$

- Find the general solution of the equation.
- Find the solution of the initial value problem with $y(0) = y'(0) = 0$.
- Identify the transient and steady-state components of the solution.
- Graph the solution of the initial value problem with $\omega = \frac{1}{2}, 1, \text{ and } \frac{3}{2}$. Which forcing frequency produces the steady-state oscillation with the greatest amplitude?

24. Consider an oscillator described by the equation

$$y'' + 2y' + (\omega_0^2 + 1)y = 2 \cos t.$$

- Find the general solution of the equation.
- Find the solution of the initial value problem with $y(0) = y'(0) = 0$.
- Identify the transient and steady-state components of the solution.
- Graph the solution of the initial value problem with $\omega_0 = 1, 2, \text{ and } 3$. Which natural frequency produces the steady-state oscillation with the greatest magnitude?

25. **An RC circuit** Show that the charge on the capacitor of a circuit

without an inductor satisfies the equation $RQ' + \frac{1}{C}Q = E(t)$

(with $L = 0$, it is an RC circuit). Find the charge on the capacitor in a circuit with a 50-ohm resistor and a 0.001-farad capacitor when it is driven by a constant 50-volt source. Does the charge reach a steady-state value? If so, what is it?

26. **An RL circuit** Show that the current in a circuit without a capacitor satisfies the equation $LI' + RI = E(t)$. Find the current in a circuit with a 200-ohm resistor and a 2-henry inductor when it is driven by a constant 100-volt source. Does the current reach a steady-state value? If so, what is it?

T 27–32. LCR circuits

27. An LCR circuit has a 10-ohm resistor, a 0.1-henry inductor, and a 1/240-farad capacitor connected in series to a constant 100-volt battery.

- Find the current in the circuit assuming that $I(0) = Q(0) = 0$.
- Identify the transient and steady-state currents.

28. The circuit in Exercise 27 (10-ohm resistor, a 0.1-henry inductor, and a 1/240-farad capacitor) is connected in series to a voltage source with output $E(t) = 100 \sin 150t$.

- Find the current in the circuit assuming that $I(0) = Q(0) = 0$.
- Identify the transient and steady-state currents.
- Graph the steady-state, transient, and total current, for $t \geq 0$.

29. An LCR circuit has an 80-ohm resistor, a 0.5-henry inductor, and a 1/3230-farad capacitor connected in series to a constant 200-volt battery.

- Find the current in the circuit assuming that $I(0) = Q(0) = 0$.
- Identify the transient and steady-state currents.

30. An LCR circuit has an 80-ohm resistor, a 0.5-henry inductor, and a 1/3232-farad capacitor connected in series to a voltage source with output $E(t) = 90.5 \sin 64t$.

- Find the current in the circuit assuming that $I(0) = Q(0) = 0$.
- Identify the transient and steady-state currents.
- Graph the steady-state, transient, and total current, for $t \geq 0$.

31. Find the charge on the capacitor and the current in an LCR circuit in which an 16-ohm resistor, a 2-henry inductor, and a 1/50-farad capacitor are connected in series to a voltage source with a constant 120-volt output. Assume $Q(0) = Q'(0) = 0$.

32. Find the charge on the capacitor and the current in an LCR circuit in which a 4-ohm resistor, a 0.5-henry inductor, and a 2/25-farad capacitor are connected in series to a voltage source with output $E(t) = 30 \sin t$. Assume $Q(0) = Q'(0) = 0$.

Further Explorations

33. **Explain why or why not** Determine whether the following statements are true and give an example or a counterexample.

- An oscillator with damping cannot have a constant-amplitude position function.
- Resonance occurs only with forced oscillations.
- Resonance as it is defined in the text (solutions of the form $y = At \sin \omega t$ or $y = At \cos \omega t$) cannot occur if there is damping in the system.
- An LC circuit ($R = 0$) has damped oscillations.
- Beats can occur in a system with damping.
- The model discussed in the text for damped oscillators with periodic forcing always has a solution consisting of a decaying transient component and a non-decaying steady-state component.

- T 34–35. **Transient vs. steady-state** Consider the following initial value problems.

- Solve the initial value problem, and identify the transient and steady-state solutions.
- Graph the solution of the initial value problem, the transient solution, and the steady-state solution.
- Approximately how long does it take for the transient solution to disappear? Confirm that as t increases, the solution of the initial value problem approaches the steady-state solution.

34. $y'' + 2y' + 5y = 10 \cos t, y(0) = 1, y'(0) = 0$

35. $y'' + \frac{1}{2}y' + \frac{17}{16}y = 65 \sin t, y(0) = 0, y'(0) = 0$

- T 36–37. **All transient solutions die** Consider the following oscillator equations.

- Find the general solution of the equation and identify the transient and steady-state solutions.
- Set $c_2 = 0$ and $c_1 = -2, -1, 0, 1, \text{ and } 2$ in the general solution. For each value of c_1 , graph the solution and external force function on the same set of axes.
- Describe the relationship between the solutions (for each value of c_1) and the external force function.

36. $y'' + 2y' + 2y = 130 \sin 4t$

37. $y'' + 3y' + 2y = 170 \cos 4t$

38. **Forced undamped solution** Show that a particular solution of the equation $y'' + \omega_0^2 y = \frac{F_0}{m} \cos \omega t$ is $y_p = \frac{F_0}{m(\omega_0^2 - \omega^2)} \cos \omega t$.

39. **Beats solution** Recall the identity $\cos A - \cos B = 2 \sin \left(\frac{B - A}{2} \right) \sin \left(\frac{B + A}{2} \right)$.

a. Show that

$$\cos \omega t - \cos \omega_0 t = 2 \sin \frac{(\omega_0 - \omega)t}{2} \sin \frac{(\omega_0 + \omega)t}{2}.$$

b. Graph the functions on both sides of the equation in part (a) with (i) $\omega_0 = 10$, $\omega = 9$ and (ii) $\omega_0 = 10$, $\omega = 2$ to verify the identity. In which case do you see beats?

40. **Analysis of the forced damped oscillation equation** Consider the equation $my'' + cy' + ky = F_0 \cos \omega t$, which describes the motion of a forced damped oscillator. Assume all the parameters in the equation are positive.

- a. Explain why the solutions of the homogeneous equation decay in time.
b. Show that a particular solution is $y_p = A \sin \omega t + B \cos \omega t$, where

$$A = \frac{c\omega F_0}{(c\omega)^2 + (k - m\omega^2)^2} \quad \text{and} \quad B = \frac{(k - m\omega^2)F_0}{(c\omega)^2 + (k - m\omega^2)^2}.$$

c. Using the amplitude-phase form of a solution, show that $y_p = A \sin \omega t + B \cos \omega t = C^* \sin(\omega t + \varphi)$, where $C^* = \sqrt{A^2 + B^2}$ and $\tan \varphi = \frac{B}{A}$.

d. Show that $C^* = \frac{F_0}{\sqrt{c^2\omega^2 + m^2(\omega_0^2 - \omega^2)^2}}$, where $\omega_0^2 = \frac{k}{m}$.

e. What is the relationship between the forcing frequency ω and the natural frequency ω_0 that produces the largest amplitude C^* ? Explain why this result is analogous to resonance in the case of forced undamped motion.

f. Let $m = c = F_0 = 1$ and $\omega_0 = 3$. Graph the amplitude C^* as a function of ω . Describe how C^* varies with respect to ω .

41. **Impedance** Use the result of Exercise 40d and write the amplitude in terms of circuit parameters; that is, replace m by L , c by R , ω_0^2 by $\frac{1}{CL}$, and F_0 by ωE_0 . Express the amplitude of the steady-state current as

$$C^* = \frac{E_0}{\sqrt{R^2 + \left(\omega L - \frac{1}{\omega C} \right)^2}}.$$

The denominator in this expression is called the **impedance** (with units of ohms). Show that the impedance is minimized (which maximizes C^*) when $\omega^2 = \frac{1}{CL}$, which is the analog of $\omega_0 = \omega$.

Maximizing C^* (minimizing the impedance) often gives the best reception in a radio receiver.

42. **Gravity in the vertical oscillator** In this derivation, we show why the gravitational force does not appear in the equation for a vertically suspended oscillator.

- a. Consider the figure in which a block hangs at rest from a spring. The spring is stretched an amount Δy by the weight mg of the block. We denote this equilibrium position of the block $y = 0$. When the system is at equilibrium, explain why $mg = k\Delta y$, where k is the spring constant.

- b. Suppose the block is pulled down a distance y from its equilibrium position. We now write Newton's second law using the end of the unstretched spring as a reference point, assuming no damping or external force and assuming the y -axis points downward. Explain why $my'' = -k(y + \Delta y) + mg$.
c. Use the equilibrium relationship $mg = k\Delta y$, to express the equation of motion as $my'' = -ky$, which is the equation derived earlier. Notice that the gravitational force does not appear.

Applications

43–46. **Horizontal oscillators** The equation of motion for a spring-block system that lies on a horizontal surface (see figure) is the same as the equation of motion for a vertically suspended system. As before, m is the mass of the block, k is the spring constant, c is the damping coefficient (perhaps due to friction as the block slides on the surface), and F_{ext} is an external force. We let $x(t)$ be the position of the block at time t , where x increases to the right and $x = 0$ is the position of the block at which the spring is neither stretched nor compressed.

- a. Find the position of the block in the following situations.
b. Graph the position function.
c. Describe the type of motion you observe.

43. $m = 2 \text{ kg}$, $c = 6 \text{ kg/s}$, $k = 8 \text{ N/m}$,
 $F_{\text{ext}} = 0$, $x(0) = 2$, $x'(0) = -1$

44. $m = 4 \text{ kg}$, $c = 8 \text{ kg/s}$, $k = 140 \text{ N/m}$,
 $F_{\text{ext}} = 0$, $x(0) = -2$, $x'(0) = 1$

45. $m = 4 \text{ kg}$, $c = 4 \text{ kg/s}$, $k = 17 \text{ N/m}$,
 $F_{\text{ext}} = 148 \sin t$, $x(0) = 0$, $x'(0) = 0$

46. $m = 8 \text{ kg}$, $c = 16 \text{ kg/s}$, $k = 136 \text{ N/m}$,
 $F_{\text{ext}} = 130 \cos t$, $x(0) = 0$, $x'(0) = 0$

47. **The pendulum equation** A pendulum consisting of a bob of mass m swinging on a massless rod of length ℓ can be modeled as an oscillator (see figure). Let $\theta(t)$ be the angular displacement of the pendulum t seconds after it is released (measured in radians). Assuming that the only force acting on the bob is the gravitational force, we write Newton's second law in the direction of motion (perpendicular to the rod). Notice that the distance along the arc of the swing is $s(t) = \ell\theta(t)$, so the velocity of the bob is $s'(t) = \ell\theta'(t)$ and the acceleration is $s''(t) = \ell\theta''(t)$.

- Considering only the component of the force in the direction of motion, explain why Newton's second law is $m\ell\theta''(t) = -mg \sin \theta(t)$, where $g = 9.8 \text{ m/s}^2$ is the acceleration due to gravity.
- Write this equation as $\theta'' + \omega_0^2 \sin \theta = 0$, where $\omega_0^2 = \frac{g}{\ell}$.
- Notice that this equation is nonlinear. It can be linearized by assuming that the angular displacements are small ($|\theta| \ll 1$) and using the approximation $\sin \theta \approx \theta$. Show that the resulting linear pendulum equation is $\theta'' + \omega_0^2 \theta = 0$.
- Express the period of the pendulum in terms of g and ℓ . If the length of the pendulum is increased by a factor of 2, by what factor does the period change?

48–49. Solving pendulum equations Use Exercise 47 and consider the following pendulum problems.

- Solve the initial value problem and graph the solution.
- Express the solution in amplitude-phase form.
- Determine the period of the pendulum.

48. $m = 1 \text{ kg}$, $\ell = 4.9 \text{ m}$, $\theta(0) = 0.25$, $\theta'(0) = 0$

49. $m = 10 \text{ kg}$, $\ell = 3 \text{ m}$, $\theta(0) = 0.4$, $\theta'(0) = -0.2$

50. **Buoyancy as a restoring force** Imagine a cylinder of length L and cross-sectional area A floating partially submerged in a calm lake (see figure). Assume that the density of the water is $\rho_w = 1000 \text{ kg/m}^3$ and the density of the cylinder is $\rho < 1000 \text{ kg/m}^3$. Archimedes' principle states that the cylinder

experiences an upward buoyant force equal to the weight of the water displaced by the cylinder.

- As shown in the figure, assume that when floating at rest a fraction y^*/L of the cylinder is submerged. Note that the weight of the cylinder is $mg = \rho ALg$ and the weight of the displaced water is $y^* \rho_w Ag$. Conclude that the fraction of the cylinder that is submerged is the ratio of the densities; that is, $\frac{y^*}{L} = \frac{\rho}{\rho_w}$.
- Let $y = 0$ correspond to the level of the bottom of the cylinder at equilibrium. Now suppose that the cylinder is pushed down from its equilibrium position and released. Let $y(t)$ be the position of the bottom of the cylinder t seconds after it is released, where y increases in the downward direction. Applying Newton's second law $my'' = F_{\text{ext}}$, explain why the buoyant force is $F_{\text{ext}} = -\rho_w A y g$ (in addition to the buoyant force that maintains the equilibrium).
- Conclude that the cylinder undergoes undamped oscillations governed by the equation

$$y'' = -\omega_0^2 y, \text{ where } \omega_0^2 = \frac{\rho_w g}{\rho L}.$$

- What is the period of the oscillations? How does the period vary with the length of the cylinder? Is the period greater when $\rho \approx \rho_w$ or when $\rho \ll \rho_w$? Explain your answer.
- According to this model, what is the period of the oscillation when $\rho = \rho_w$? Describe this situation physically.

51–52. Solving buoyancy equations Use Exercise 50 and consider the following buoyant cylinders that oscillate with the given initial conditions.

- Solve the initial value problem and graph the solution.
- Express the solution in amplitude-phase form.
- Determine the period of the oscillation.

51. $L = 4.9 \text{ m}$, $\frac{\rho}{\rho_w} = \frac{1}{2}$, $y(0) = 0.25$, $y'(0) = 0$

52. $L = 2 \text{ m}$, $\frac{\rho}{\rho_w} = 0.7$, $y(0) = 0.5$, $y'(0) = 0$

53. **Compartment models and drug metabolism** Compartment models are used to simulate manufacturing processes, ecological systems, and the assimilation of drugs by the body (pharmacokinetics). The figure shows a two-compartment model for a drug assimilation problem. Compartment 1 corresponds to the blood volume, which has an input of the drug at a specified rate f . Compartment 2 cor-

responds to the kidneys and has an outflow of the drug determined by the rate constant k_3 . In addition, there is exchange of the drug between the compartments determined by the rate constants k_1 and k_2 (see figure). Let $x_1(t)$ and $x_2(t)$ be the amount of drug in each compartment t time units after the dosing begins. The equations that describe the amount of drug in each compartment are

$$x_1' = \underbrace{-k_1x_1}_{\substack{\text{outflow} \\ \text{from 1}}} + \underbrace{k_2x_2}_{\substack{\text{inflow} \\ \text{from 2}}} + \underbrace{f(t)}_{\substack{\text{input} \\ \text{from} \\ \text{outside}}}$$

$$x_2' = \underbrace{k_1x_1}_{\substack{\text{inflow} \\ \text{from 1}}} - \underbrace{k_2x_2}_{\substack{\text{outflow} \\ \text{from 2}}} - \underbrace{k_3x_2}_{\substack{\text{outflow} \\ \text{to outside}}}$$

- a. Advanced methods can be used to solve two first-order differential equations. Alternatively, we can convert these two equations to an equivalent second-order equation that we can solve. Differentiate the first equation with respect to t and use the second equation to eliminate x_2 and x_2' . Show that the resulting equation is

$$x'' = -(k_1 + k_2 + k_3)x' - k_1k_3x + (k_2 + k_3)f(t) + f'(t),$$

where we have replaced x_1 by x .

- b. Show that the initial conditions $x_1(0) = A, x_2(0) = 0$ become $x(0) = A, x'(0) = -k_1x(0) + f(0)$, where again we have replaced x_1 by x .

54–55. Solving compartment models Use Exercise 53 and consider the following compartment models with the given initial conditions.

- a. Solve the initial value problem for the mass of drug in compartment 1.
b. Determine the mass of drug in compartment 2.
c. Graph the mass of drug in both compartments and interpret the solutions.

54. $k_1 = 0.1, k_2 = 0.02, k_3 = 0.05, f(t) = 1, x_1(0) = x_2(0) = 0$
(infusion: constant input)

55. $k_1 = 0.1, k_2 = 0.02, k_3 = 0.05, f(t) = 0, x_1(0) = 10, x_2(0) = 0$
(injection at $t = 0$)

QUICK CHECK ANSWERS

1. Damped, free oscillations; undamped, forced oscillations. 2. Period = $2\pi/4.5$, 4.5 oscillations per 2π time units, $4.5/2\pi$ oscillations per time unit. 3. The sound is loudest at the peaks of the long wave: $t = \pi/2, 3\pi/2, \dots$. 4. The value of the limit is 0; solutions decay in magnitude for all A and a . ◀

D2.5 Complex Forcing Functions

The oscillator equation with damping and external forcing is the most general equation we have considered, and it is used to model both mechanical and electrical oscillators. For this reason, we investigate this equation in more detail.

The Transfer Function

The oscillator equation

$$my'' + cy' + ky = f^*(t),$$

models a *time-invariant* system because the characteristics of the system, described by the coefficients m , c , and k , are constant in time. Dividing through this equation by m , it can be written

$$y'' + by' + \omega_0^2 y = F(t), \text{ where } b = \frac{c}{m}, \omega_0^2 = \frac{k}{m}, \text{ and } F(t) = \frac{f^*}{m};$$

all terms in the equation are accelerations. Recall that b measures the damping in the system and $\omega_0 > 0$ is the natural frequency of the oscillator. We consider the case of *passive systems*, in which $b > 0$.

As already shown, the solution to this equation has two components: a transient solution that involves the initial conditions and decays in time, and a (particular) steady-state solution that is determined by the forcing function F . Our goal is to study the steady-state solution in the presence of periodic forcing functions. Therefore, we make two assumptions to focus the discussion.

- The initial phase α is included to account for possible time delays in the forcing function.

First, we assume zero initial conditions $y(0) = y'(0) = 0$, which removes the transient solution. Second, we consider oscillatory forcing functions of the form

$$F(t) = F_0 \cos(\omega t + \alpha),$$

where the amplitude F_0 , the forcing frequency ω , and the initial phase α are specified.

For time-invariant linear systems, it is advantageous to work with complex-valued exponential forcing functions. Noting that $F_0 \cos(\omega t + \alpha) = \operatorname{Re}\{F_0 e^{i(\omega t + \alpha)}\}$, we consider forcing functions of the form

$$F(t) = F_0 e^{i(\omega t + \alpha)} = \underbrace{F_0 e^{i\alpha}}_f e^{i\omega t} = f e^{i\omega t}.$$

The constant $f = F_0 e^{i\alpha}$ is the **initial complex amplitude**; its magnitude is

$$|f| = |F_0 e^{i\alpha}| = |F_0| \underbrace{|e^{i\alpha}|}_1 = |F_0|.$$

You will see that using a forcing function of this form simplifies the work of finding solutions. To find a particular solution of the equation

$$y'' + by' + \omega_0^2 y = f e^{i\omega t},$$

we once again apply the method of undetermined coefficients and use the trial solution $y_p = A e^{i\omega t}$, where A is to be determined. Substituting y_p into the equation results in the following calculation:

$$\begin{aligned} (A e^{i\omega t})'' + b(A e^{i\omega t})' + \omega_0^2 A e^{i\omega t} &= f e^{i\omega t} && \text{Substitute } y_p. \\ -A\omega^2 e^{i\omega t} + bA i\omega e^{i\omega t} + \omega_0^2 A e^{i\omega t} &= f e^{i\omega t} && \text{Differentiate; } i^2 = -1. \\ e^{i\omega t} A(-\omega^2 + ib\omega + \omega_0^2) &= f e^{i\omega t}. && \text{Collect terms.} \end{aligned}$$

The common factor $e^{i\omega t}$ is nonzero and may be cancelled. Recalling that the goal is to determine A , we find that

$$\begin{aligned} A(-\omega^2 + ib\omega + \omega_0^2) &= f && \text{Cancel } e^{i\omega t}. \\ A &= \frac{f}{-\omega^2 + ib\omega + \omega_0^2} && \text{Solve for } A. \end{aligned}$$

Therefore, the particular solution to the equation becomes

$$y_p = A e^{i\omega t} = \underbrace{\frac{1}{-\omega^2 + ib\omega + \omega_0^2}}_{H(\omega)} f e^{i\omega t} = H(\omega) f e^{i\omega t}.$$

The function

$$H(\omega) = \frac{1}{-\omega^2 + ib\omega + \omega_0^2}$$

that we have defined is called the *transfer function* for the time-invariant linear system. It depends on the damping constant b , the natural frequency ω_0 , and the forcing frequency ω . We write H as a function of ω , because we hold the system parameters b and ω_0 fixed and analyze the response of the system as the forcing frequency ω varies.

As a complex quantity, we can write the transfer function in the polar form

$$H(\omega) = g(\omega)e^{i\gamma(\omega)},$$

► Recall that a complex number $z = x + iy$ can be written in the polar form $re^{i\theta}$, where $r = |z| = \sqrt{x^2 + y^2}$ and $\tan \theta = y/x$.

where $g(\omega) = |H(\omega)|$ is the *gain function* of the system and the phase angle $\gamma(\omega)$ is the *phase lag function*. Note that the input function F and the output y_p have the same frequency ω . The phase lag function $\gamma(\omega)$ gives the phase of the output *relative* to the input, for all times.

We show next that for passive systems ($b > 0$), the phase lag function is negative ($\gamma(\omega) < 0$), which means the output *lags* the input (hence the terminology). For active systems ($b < 0$), the phase lag is positive and the output *leads* the input.

A short calculation (Exercise 22) allows us to split H into its real and imaginary parts:

$$H(\omega) = \frac{1}{-\omega^2 + ib\omega + \omega_0^2} = \underbrace{\frac{\omega_0^2 - \omega^2}{(\omega_0^2 - \omega^2)^2 + b^2\omega^2}}_{H_r(\omega)} - i \underbrace{\frac{b\omega}{(\omega_0^2 - \omega^2)^2 + b^2\omega^2}}_{H_i(\omega)}.$$

We now find that the gain function is

$$g(\omega) = |H(\omega)| = \sqrt{H_r(\omega)^2 + H_i(\omega)^2} = \frac{1}{\sqrt{(\omega_0^2 - \omega^2)^2 + b^2\omega^2}}.$$

Similarly, the phase lag function is given by

$$\tan \gamma(\omega) = \frac{H_i(\omega)}{H_r(\omega)} = -\frac{b\omega}{\omega_0^2 - \omega^2}.$$

As shown shortly, the phase lag function has values in the interval $-\pi < \gamma(\omega) \leq 0$.

SUMMARY Transfer, Gain, and Phase Lag Functions

The oscillator equation $y'' + by' + \omega_0^2 y = F(t)$ has the **transfer function**

$$H(\omega) = g(\omega)e^{i\gamma(\omega)} = \frac{1}{-\omega^2 + ib\omega + \omega_0^2},$$

where the **gain function** is

$$g(\omega) = |H(\omega)| = \frac{1}{\sqrt{(\omega_0^2 - \omega^2)^2 + b^2\omega^2}}$$

and the **phase lag function** is given by

$$\tan \gamma(\omega) = -\frac{b\omega}{\omega_0^2 - \omega^2}.$$

The transfer function completely defines the relationship between the input and the output (or response) of the system. Conceptually, the transfer function “transfers” the input into the output, in the following way:

$$\text{Input: } F(t) = fe^{i\omega t} \xrightarrow{H(\omega)} \text{Output: } y_p(t) = \underbrace{H(\omega)}_{g(\omega)e^{i\gamma(\omega)}} f e^{i\omega t}.$$

Both the input and output are complex functions. However, it is their real parts that give directly measurable quantities. Specifically, the real part of the input is

$$\operatorname{Re}\{F(t)\} = F_0 \cos(\omega t + \alpha),$$

and the real part of the output is

$$\begin{aligned}
 \operatorname{Re}\{y_p(t)\} &= \operatorname{Re}\{H(\omega)f e^{i\omega t}\} && \text{Substitute for } y_p. \\
 &= \operatorname{Re}\left\{\underbrace{g(\omega)}_{H(\omega)} \underbrace{e^{i\gamma(\omega)}}_f F_0 e^{i\alpha} e^{i\omega t}\right\} && \text{Substitute for } H(\omega) \text{ and } f. \\
 &= g(\omega)F_0 \cdot \operatorname{Re}\{e^{i\gamma(\omega)} e^{i\alpha} e^{i\omega t}\} && g(\omega) \text{ and } F_0 \text{ are real.} \\
 &= g(\omega)F_0 \cos(\omega t + \alpha + \gamma(\omega)). && e^a e^b = e^{a+b} \text{ and } \operatorname{Re}\{e^{i\theta}\} = \cos \theta
 \end{aligned}$$

- Note that if $\cos(\omega t + \alpha)$ is the input and $\cos(\omega t + \alpha + \gamma)$ is the output with $\gamma < 0$, then the graph of the output is the graph of the input shifted to the *right*. Therefore, the output lags the input.

We see that the output amplitude $g(\omega)F_0$ is $g(\omega)$ multiplied by the input amplitude F_0 , while the output lags the input at all times (because $\gamma(\omega) < 0$ when $b > 0$).

SUMMARY Solution of Forced Oscillator Equations

The oscillator equation

$$y'' + by' + \omega_0^2 y = \underbrace{\operatorname{Re}\{f e^{i\omega t}\}}_{\text{input}} = F_0 \cos(\omega t + \alpha)$$

has the solution (output)

$$\operatorname{Re}\{y_p(t)\} = g(\omega)F_0 \cos(\omega t + \alpha + \gamma(\omega)),$$

where g is the gain function and γ is the phase lag function.

Properties of the Transfer Function

The transfer function—specifically its components, the gain and phase lag functions—are fundamental in the design of acoustical and electrical filters, noise canceling devices, and other instruments. So let's look at them more closely.

The forcing frequency that produces the maximum response of the system is often of practical interest. In some cases (often mechanical), this frequency is to be avoided, whereas in other cases (often electrical) it is sought because it corresponds to the optimal performance of a device. It can be shown (Exercise 23) that the gain function

$$g(\omega) = \frac{1}{\sqrt{(\omega_0^2 - \omega^2)^2 + b^2\omega^2}}$$

has a maximum value at $\omega = \sqrt{\omega_0^2 - \frac{b^2}{2}}$, provided $b < \sqrt{2}\omega_0$, which corresponds to weak damping. In the strong damping case ($b \geq \sqrt{2}\omega_0$), the maximum value of g occurs at $\omega = 0$.

The case shown in Figure D2.30a ($b = 0.5$ and $\omega_0 = 1$) corresponds to weak damping, and the gain function is maximized when $\omega \approx 0.935$. In general, as the damping b approaches zero, the location of the peak in the gain curve occurs closer and closer to ω_0 , the natural frequency of the system. Recall that in an *undamped* system, the condition $\omega = \omega_0$ gives rise to *resonance* (unbounded growth of solutions). In a weakly damped system, maximum amplitudes occur when $\omega \approx \omega_0$.

Let's look at the phase lag function (Figure D2.30b)

$$\tan \gamma(\omega) = -\frac{b\omega}{\omega_0^2 - \omega^2}.$$

Notice that $\gamma(0) = 0$, which means that if the forcing frequency is zero ($\omega = 0$), the driving force and the output are constant, and there is no lag between the input and the output. When ω is small and positive, $\gamma(\omega)$ is small and negative, implying that the response

- If $\gamma = 0$, the input and output are in phase; their maxima and minima coincide. If $\gamma = \pm\pi/2$, the input and output are a quarter-period out of phase. If $\gamma = \pm\pi$, the phase lag is a maximum, and the input and output are a half-period (or 180 degrees) out of phase.

FIGURE D2.30

of the oscillator closely follows the variations in the driving force. As ω increases, $\gamma(\omega)$ decreases monotonically and as $\omega \rightarrow \omega_0^-$, we see that $\tan \gamma(\omega) \rightarrow -\infty$, which implies that $\gamma(\omega) \rightarrow -\frac{\pi}{2}$. As ω continues to increase, $\tan \gamma(\omega) \rightarrow 0$, which means $\gamma(\omega) \rightarrow -\pi$. We see that the phase lag function always lies in the interval $-\pi < \gamma(\omega) \leq 0$. Summarized briefly, the greater the forcing frequency, the greater the phase lag between the input and output.

EXAMPLE 1 Gain and phase lag Consider the oscillator equation $y'' + by' + \omega_0^2 y = F_0 \cos \omega t$, where $\omega_0 = 1$, $b = 0.5$, and $F_0 = 2$ (the gain and phase lag functions are shown in Figure D2.30).

- Find the gain and phase lag functions.
- Assuming $y(0) = y'(0) = 0$, find and graph the solution of equation $\operatorname{Re}\{y_p\}$ with forcing frequencies $\omega = 0.8$ and $\omega = 2$.

SOLUTION

- With the given values of ω_0 and b , the gain function is

$$g(\omega) = \frac{1}{\sqrt{(1 - \omega^2)^2 + \frac{\omega^2}{4}}},$$

and the phase lag function is given by

$$\tan \gamma(\omega) = -\frac{\omega/2}{1 - \omega^2}.$$

- Recall that the particular solution of the differential equation is

$$\operatorname{Re}\{y_p\} = g(\omega)F_0 \cos(\omega t + \gamma(\omega)).$$

Letting $\omega = 0.8$, we find that $g(0.8) \approx 1.86$ and $\gamma(0.8) \approx -0.84$. Therefore, with $F_0 = 2$, the solution is

$$\operatorname{Re}\{y_p\} = 1.86 \cdot 2 \cdot \cos(0.8t - 0.84) = 3.72 \cos(0.8t - 0.84).$$

The graphs of the forcing function $F(t) = 2 \cos 0.8t$ and the real part of the solution are shown in Figure D2.31. We see that the amplitude of the forcing function is $F_0 = 2$ and the amplitude of the solution is nearly twice that amount, reflecting the amplification by a factor of $g(0.8) \approx 1.86$. Also note that the first local maximum

of the solution (output) curve occurs *after* the first maximum of the forcing function curve, reflecting the phase lag. To estimate the actual shift in the curves, we write

$$\cos(0.8t - 0.84) = \cos\left(0.8\left(t - \frac{0.84}{0.8}\right)\right) = \cos(0.8(t - 1.05)).$$

In this form, we see the shift (to the right) of the solution curve relative to the forcing function curve is approximately 1.05, consistent with Figure D2.31. In general, the shift in the curves is given by $\frac{\gamma(\omega)}{\omega}$.

FIGURE D2.31

With the higher forcing frequency $\omega = 2$, we find that $g(2) \approx 0.32$ and $\gamma(2) \approx -2.82$. The solution is now

$$\operatorname{Re}\{y_p\} = 0.32 \cdot 2 \cdot \cos(2t - 2.82) = 0.64 \cos(2t - 2.82).$$

The graphs of the forcing function and the real part of the solution are shown in Figure D2.32. In this case, the amplitude of the solution (output) is reduced by a factor of $g(2) \approx 0.32$. The first maximum of the solution curve again lags the first maximum of the forcing function curve. The shift in the curves is

$$\frac{\gamma(\omega)}{\omega} = \frac{\gamma(2)}{2} \approx -1.41, \text{ consistent with Figure D2.32.}$$

FIGURE D2.32

Related Exercises 5–16 ◀

A different view of the gain function is shown in Figure D2.33. In this figure we fix $\omega_0 = 1$ and let $b = 0.3, 1$, and 3 . For $b \geq \sqrt{2}\omega_0$ (strong damping), the amplitude curve has a single local maximum at $\omega = 0$ with a value of 1 . In this case, the values of the gain

function are less than 1 in magnitude, meaning the amplitude of the response (output) is less than the amplitude of the forcing function (input). At $b = \sqrt{2}\omega_0$, the gain curves “flip” and for $b < \sqrt{2}\omega_0$ (weak damping), we see values of the gain that are greater than 1. In this weak damping case, it is possible to amplify the amplitude of the response provided the forcing frequency is chosen appropriately.

FIGURE D2.34

EXAMPLE 2 A low-pass filter Consider the LCR circuit shown in Figure D2.34.

- Derive the differential equation for v_{out} .
- Find the transfer function and compute the gain function.
- Give the relationship between v_{in} and v_{out} .
- Find the relationship among L , C , and R such that the gain function is monotonically decreasing, for $0 \leq \omega < \infty$.
- Compute the gain function and compute the ratio $\left| \frac{v_{\text{out}}}{v_{\text{in}}} \right|$ (as a function of ω) when $L = 0.5$, $C = 1/25$, and $R = 6$. Interpret this result.

SOLUTION

- a. By Kirchhoff's voltage law (see Section D2.4) we have

$$v_{\text{in}} - RI - L \frac{dI}{dt} - v_{\text{out}} = 0.$$

The voltage drop across the capacitor is $v_{\text{out}} = \frac{Q}{C}$. Differentiating both sides of this expression and using $I = Q'(t)$ gives $v'_{\text{out}} = \frac{Q'}{C} = \frac{I}{C}$, or $I = Cv'_{\text{out}}$. Substituting for I in the voltage law gives a second-order differential equation for v_{out} :

$$v_{\text{in}} - RCv'_{\text{out}} - LCv''_{\text{out}} - v_{\text{out}} = 0.$$

Dividing through by LC and rearranging, the equation becomes

$$v''_{\text{out}} + \frac{R}{L}v'_{\text{out}} + \frac{1}{LC}v_{\text{out}} = \frac{1}{LC}v_{\text{in}} = \frac{1}{LC} \underbrace{fe^{i\omega t}}_{v_{\text{in}}},$$

where we have assumed that the input function is the complex exponential $v_{\text{in}} = fe^{i\omega t}$.

- b.** To obtain the transfer function, we use the definition given previously with $b = \frac{R}{L}$ and

$\omega_0^2 = \frac{1}{LC}$. The result is that

$$H(\omega) = \frac{1}{-\omega^2 + i\omega\frac{R}{L} + \frac{1}{LC}} = \frac{\frac{1}{LC} - \omega^2 - i\frac{R}{L}\omega}{\left(\frac{1}{LC} - \omega^2\right)^2 + \left(\frac{R}{L}\right)^2\omega^2}.$$

We compute the gain function

$$g(\omega) = |H(\omega)| = \sqrt{H_r(\omega)^2 + H_i(\omega)^2}$$

and find that

$$g(\omega) = \frac{1}{\sqrt{\left(\frac{1}{LC} - \omega^2\right)^2 + \left(\frac{R}{L}\right)^2\omega^2}}.$$

- c.** The input to the system is $v_{\text{in}} = f e^{i\omega t}$ and the right side of the differential equation is $\frac{1}{LC}v_{\text{in}}$. Therefore, the output of the system is

$$v_{\text{out}} = H(\omega) \frac{1}{LC} v_{\text{in}}.$$

- d.** To analyze the behavior of the gain function, we locate the local extrema of g . Observe that g has a local maximum at the same points that the denominator has a local minimum. Furthermore, to minimize the denominator, we can simply minimize the quantity

$$h(\omega) = \left(\frac{1}{LC} - \omega^2\right)^2 + \left(\frac{R}{L}\right)^2\omega^2$$

under the square root in the denominator. To find the critical points of h , we compute

$$\begin{aligned} h'(\omega) &= 2\left(\frac{1}{LC} - \omega^2\right)(-2\omega) + 2\left(\frac{R}{L}\right)^2\omega \quad \text{Differentiate.} \\ &= 2\omega\left(2\left(\omega^2 - \frac{1}{LC}\right) + \left(\frac{R}{L}\right)^2\right). \quad \text{Simplify.} \end{aligned}$$

We see that $h'(0) = 0$, so $\omega = 0$ is a critical point for all values of L , C , and R . Additional critical points, if they exist, satisfy

$$2\left(\omega^2 - \frac{1}{LC}\right) + \left(\frac{R}{L}\right)^2 = 0.$$

After some simplification, this condition becomes

$$\omega^2 = \frac{1}{LC} - \frac{R^2}{2L^2}.$$

The critical point on the interval $\omega > 0$ is

$$\omega = \sqrt{\frac{1}{LC} - \frac{R^2}{2L^2}},$$

provided $\frac{1}{LC} - \frac{R^2}{2L^2} \geq 0$ or $R \leq \sqrt{\frac{2L}{C}}$. A bit more analysis shows that this critical point corresponds to a local minimum of h and therefore, a local maximum of g . To summarize,

- if $R \leq \sqrt{\frac{2L}{C}}$, then g has a local maximum for $\omega > 0$;
- if $R > \sqrt{\frac{2L}{C}}$, then g has a local maximum at $\omega = 0$ and is monotonically decreasing for $\omega \geq 0$.

Notice that for all parameter values $g(0) = LC$.

- e. Substituting the given values of L , C , and R , we see that $R > \sqrt{\frac{2L}{C}}$, so we expect the gain function to have a single maximum at $\omega = 0$. Using these parameter values, the gain function is

$$g(\omega) = |H(\omega)| = \frac{1}{\sqrt{\left(\frac{1}{LC} - \omega^2\right)^2 + \left(\frac{R}{L}\right)^2 \omega^2}} = \frac{1}{\sqrt{(50 - \omega^2)^2 + 144\omega^2}}.$$

To interpret the gain function, we compute the magnitude of the ratio of the output to the input. Using part (c), we have

$$\begin{aligned} \left| \frac{v_{\text{out}}}{v_{\text{in}}} \right| &= \left| \frac{H(\omega) \frac{1}{LC} v_{\text{in}}}{v_{\text{in}}} \right| && \text{Substitute.} \\ &= \frac{g(\omega)}{LC} && \text{Simplify; } |H(\omega)| = g(\omega). \\ &= \frac{1}{LC} \frac{1}{\sqrt{(50 - \omega^2)^2 + 144\omega^2}} && \text{Substitute for } g. \end{aligned}$$

► A similar analysis for a high-pass filter is given in Exercises 24–28.

By graphing this ratio, we can see the effect of various forcing frequencies ω on the input signal. The graph (Figure D2.35) indicates that all forcing frequencies produce an attenuation of the input signal. However, the low frequencies are attenuated the least, whereas frequencies with $\omega > 10$ are reduced in magnitude by a factor of at least 0.5. Because the low frequencies are allowed to “pass,” the circuit is called a *low-pass filter*.

FIGURE D2.35

Related Exercises 17–20 ◀

Extensions

We have shown how the transfer function is used to find and interpret solutions of oscillator equations. The extensions of these ideas are also powerful. Let's proceed in steps.

Suppose the forcing function consists of two components with two different frequencies ω_1 and ω_2 ; that is,

$$F(t) = F_1 e^{i\omega_1 t} + F_2 e^{i\omega_2 t}.$$

Because the differential equation is linear, we may superimpose the solutions corresponding to each component individually. The resulting solution is

$$y = H(\omega_1)F_1 e^{i\omega_1 t} + H(\omega_2)F_2 e^{i\omega_2 t}.$$

Recall that once b and ω_0 are specified, we have a single transfer function, and it is easy to compute $H(\omega_1)$ and $H(\omega_2)$.

Now suppose that the forcing function is a sum of n components with different frequencies and amplitudes; that is,

$$F(t) = \sum_{k=1}^n F_k e^{i\omega_k t}.$$

Once again, we may superimpose solutions of individual equations and give the solution in the form

$$y = \sum_{k=1}^n H(\omega_k)F_k e^{i\omega_k t}.$$

As before, once the transfer function is determined, it is easy to compute the values of $H(\omega_k)$, for $k = 1, \dots, n$.

We can now make a remarkable leap. Suppose the forcing function F is *any* smooth periodic function. Then it is possible to represent F in terms of a *Fourier series* of the form

$$F(t) = \sum_{k=1}^{\infty} F_k e^{i\omega_k t}.$$

Formally the method of solution outlined above can be carried out and the solution can also be expressed in terms of a Fourier series.

Let's take one final step. If the forcing function is any function—not necessarily periodic—that meets fairly general conditions, it can be expressed in terms of a *Fourier integral*. Again the method of solution outlined above works and the solution can be expressed in terms of a Fourier integral. The simple idea of using a complex exponential forcing function proves to be incredibly powerful and leads to the solution of a wide range of oscillator problems.

SECTION D2.5 EXERCISES

Review Questions

1. Write the transfer function in terms of the gain and phase lag functions.
2. For the systems discussed in this section, explain the relationship between the input and the output in terms of the gain function.
3. For the systems discussed in this section, explain the relationship between the input and the output in terms of the phase lag function.
4. Use a graph to explain what it means for the output to lag the input.

Basic Skills

5–10. Gain and phase lag functions Consider the oscillator equation $y'' + by' + \omega_0^2 y = F_0 \cos \omega t$.

- a. Write and graph the gain function and the phase lag function for following systems.
- b. Find the location of the local maximum of the gain function for $\omega \geq 0$. State whether the system has strong or weak damping.

5. $b = 1, \omega_0 = 1$
6. $b = 3, \omega_0 = 1$
7. $b = 0.1, \omega_0 = 1$
8. $b = 90, \omega_0 = 100$
9. $b = 150, \omega_0 = 100$
10. $b = 300, \omega_0 = 400$

T 11–16 Solutions to oscillator equations Consider the oscillator equation $y'' + by' + \omega_0^2 y = F_0 \cos \omega t$. For the following parameter values, do the following.

- a. Find the gain and phase lag functions (see Exercises 5–10).
- b. Find the real part of the solution.
- c. Graph the forcing function and the real part of the solution. Verify that the gain function and phase lag function are correct.

11. $b = 1, \omega_0 = 1, F_0 = 2, \omega = 2$
12. $b = 3, \omega_0 = 1, F_0 = 10, \omega = 1$
13. $b = 0.1, \omega_0 = 1, F_0 = 5, \omega = 3$
14. $b = 90, \omega_0 = 100, F_0 = 50, \omega = 50$
15. $b = 150, \omega_0 = 100, F_0 = 80, \omega = 200$
16. $b = 300, \omega_0 = 400, F_0 = 150, \omega = 200$

T 17–20. Analyzing circuit equations Consider the circuit equation

$$v''_{\text{out}} + \frac{R}{L}v'_{\text{out}} + \frac{1}{LC}v_{\text{out}} = \frac{1}{LC}v_{\text{in}} = \frac{1}{LC}fe^{i\omega t}.$$

- a. For the given parameter values, compute the gain function.
- b. Graph the gain function and find the location of its maximum value for $\omega \geq 0$.
- c. On what interval is the gain function monotonically decreasing?
- d. Compute and graph the ratio $\left| \frac{v_{\text{out}}}{v_{\text{in}}} \right|$ and interpret the result.

17. $L = 2, C = 1/144, R = 20$
18. $L = 2, C = 1/144, R = 40$
19. $L = 8, C = 1/120, R = 400$
20. $L = 8, C = 1/100, R = 30$

Further Explorations

21. Explain why or why not Determine whether the following statements are true and give an example or a counterexample.

- a. The transfer function for a forced oscillator equation is independent of the forcing function.
- b. The transfer function for an undamped oscillator is a real-valued function.

22. Real and imaginary parts Show that the transfer function discussed in this section can be expressed in terms of its real and imaginary parts in the form

$$H(\omega) = \frac{1}{-\omega^2 + i\omega b + \omega_0^2} = \frac{\omega_0^2 - \omega^2}{(\omega_0^2 - \omega^2)^2 + b^2\omega^2} - i \frac{b\omega}{(\omega_0^2 - \omega^2)^2 + b^2\omega^2}.$$

T 23. Maximum value of the gain function The goal is to determine the location of the maximum value of the gain function

$$g(\omega) = \frac{1}{\sqrt{(\omega_0^2 - \omega^2)^2 + b^2\omega^2}}.$$

- a. Explain why the local maximum values of g , for $\omega \geq 0$, occur at the same points as the local minimum values of the denominator.
- b. Explain why the local maximum values of g , for $\omega \geq 0$, occur at the same points as the local minimum values of $h(\omega) = (\omega_0^2 - \omega^2)^2 + b^2\omega^2$.
- c. Show that $h'(\omega) = 2\omega(b^2 - 2\omega_0^2 + 2\omega^2)$.
- d. Show that if $b < \sqrt{2}\omega_0$, then g has a local maximum at $\omega = \sqrt{\omega_0^2 - \frac{b^2}{2}}$. What is the maximum value of g ?
- e. Show that if $b \geq \sqrt{2}\omega_0$, then g is monotonically decreasing for $\omega \geq 0$, and has a local maximum at $\omega = 0$.
- f. Which case, part (d) or part (e), corresponds to strong damping? Explain.

T 24. A high-pass filter Consider the LCR circuit shown in the figure.

- a. Explain why Kirchhoff's voltage law for the circuit is

$$v_{\text{in}} - RI(t) - \frac{Q(t)}{C} - v_{\text{out}} = 0.$$

- b. Use the facts that $I(t) = Q'(t)$ and the voltage across the inductor is $v_{\text{out}} = LI'(t) = LQ''(t)$ to show that the equation for the charge on the capacitor is

$$Q'' + \frac{R}{L}Q' + \frac{1}{LC}Q = \frac{1}{L}v_{\text{in}} = \frac{1}{L}fe^{i\omega t}.$$

- c. Find the transfer function for the equation and compute the gain function.
- d. Show that the solution of the differential equation is

$$Q(t) = H(\omega)\frac{1}{L}fe^{i\omega t}. \text{ Then conclude that } Q''(t) = -\omega^2 Q(t).$$

- e. Now we must relate v_{out} to Q . Use part (b) to show that

$$v_{\text{out}} = -\omega^2 L Q = -\omega^2 L H(\omega) \frac{1}{L} f e^{i\omega t} = -\omega^2 H(\omega) v_{\text{in}}.$$

- f. The quantity of interest is the ratio of the magnitudes of the input and the output. Show that

$$\left| \frac{v_{\text{out}}}{v_{\text{in}}} \right| = \omega^2 |H(\omega)| = \omega^2 g(\omega) = \frac{\omega^2}{\sqrt{\left(\omega^2 - \frac{1}{LC}\right)^2 + \frac{R^2}{L^2} \omega^2}}.$$

- g. Show that for $R > \sqrt{\frac{2L}{C}}$ the ratio in part (f) is monotonically increasing for $\omega > 0$.
 h. Under what conditions, if any, does the ratio in part (f) have a local extremum for $\omega > 0$?
 i. Explain why the circuit is called a *high-pass filter*.

25–28. High-pass filters Consider the high-pass filter equation in Exercise 24.

- a. For the given parameter values, compute the gain function.
 b. Graph the gain function and describe its behavior for $\omega \geq 0$.
 c. Compute and graph the ratio $\left| \frac{v_{\text{out}}}{v_{\text{in}}} \right|$ and interpret the result.

25. $L = 0.2, C = 1/250, R = 8$

26. $L = 0.2, C = 1/250, R = 12$

27. $L = 40, C = 1/2000, R = 10$

28. $L = 40, C = 1/2000, R = 30$

CHAPTER D2 REVIEW EXERCISES

1. **Explain why or why not** Determine whether the following statements are true and give an example or a counterexample.
 a. The equation $y'' + 2y' - ty = 0$ is second order, linear, and homogeneous.
 b. The equation $y'' + 2y' - y^2 = 3$ is second order, linear, and nonhomogeneous.
 c. To solve the equation $t^2 y'' + 2ty' + 4y = 0$, use the trial solution $y = e^{rt}$ and find r .
 d. To find the particular solution of the equation $y'' - 2y' + y = e^t$, use the trial solution $y_p = Ae^t$.
 e. The function $y = 0$ is always a solution of a second-order linear homogeneous equation.

2–9. Solving homogeneous equations Find the general solution of the following homogeneous equations.

2. $y'' + y' - 6y = 0$
 3. $y'' - 2y' - 8y = 0$
 4. $y'' + 8y = 0$
 5. $y'' + 36y = 0$
 6. $y'' + 4y' + 13y = 0$
 7. $y'' + 4y' + 4y = 0$
 8. $t^2 y'' + 3ty' + 8y = 0$, for $t > 0$
 9. $y'' - 2y' + 5y = 0$

10–15. Particular solutions Find a particular solution of for the following equations.

10. $y'' - 3y' - 4y = 2e^{2t}$
 11. $y'' + 25y = 3 \cos 2t$
 12. $y'' - y' - 2y = 3t^2 + 10$
 13. $y'' + 5y' - 6y = t + 2e^{-t}$

14. $y'' - y' - 6y = 2e^{-2t}$

15. $y'' + 16y = 2 \cos 4t$

16–21. General solutions Find the general solution of the following equations.

16. $y'' - 6y' - 7y = 4e^t$

17. $y'' + 4y = 3 \sin 3t$

18. $y'' - 2y' + 2y = 1 + e^{-t}$

19. $y'' + 4y' + 5y = 2 \cos t$

20. $y'' + 4y' - 32y = 1 + 2t$

21. $y'' - y = 2e^t$

22. Forced undamped oscillations A 4-kg block hangs on a spring with spring constant $k = 16$ N/m. The system is driven by an external force of $F_{\text{ext}} = 4 \cos \omega t$. Assume no initial displacement and velocity of the block, and no damping. Graph the solution in two cases: $\omega = 2.2$ and $\omega = 4$. In which case does the solution have beats?

23. Free damped oscillations A 0.2-kg block hangs on a spring with spring constant $k = 20$ N/m. Friction in the system is modeled with a damping coefficient of c kg/s. Solve an initial value problem with the following values of c and initial conditions $y(0) = 1, y'(0) = 0$. Graph each solution and state whether the problem exhibits underdamping, overdamping, or critical damping.

- a. $c = 3$ kg/s
 b. $c = 4$ kg/s
 c. $c = 5$ kg/s

24. Forced damped oscillations A 10-kg block hangs from a spring with spring constant $k = 62.5$ N/m. The block oscillates in a fluid that produces resistance with a damping constant $c = 40$ kg/s. The support of the spring vibrates and produces an external force

of $F_{\text{ext}} = 10 \cos 2t$. Assume the block is initially at rest at the equilibrium position and released with no velocity.

- Find and graph the position of the block after it is released.
- Identify the transient and steady state solutions, and graph them separately.
- After approximately how many seconds does the transient solution become negligible?
- Find the position function of the block using a transfer function and confirm that your solution is consistent with part (a).

25. An LCR circuit An LCR circuit consists of a 10-ohm resistor, a 0.1-henry inductor, and a $1/240$ -farad capacitor connected in series to a variable voltage source with output $E(t) = 200 \sin 60t$.

- Find the current in the circuit, assuming that $I(0) = Q(0) = 0$.
- Identify the transient and steady-state currents.
- Graph the steady-state, transient, and total current, for $t \geq 0$.
- Find the current using a transfer function and check for agreement with part (a).

Chapter D2 Guided Projects

Applications of the material in this chapter and related topics can be found in the following Guided Projects. For additional information, see the Preface.

Appendix

Proofs of Selected Theorems

THEOREM 2.3 Limit Laws

Assume $\lim_{x \rightarrow a} f(x)$ and $\lim_{x \rightarrow a} g(x)$ exist. The following properties hold, where c is a real number, and $n > 0$ is an integer.

1. **Sum** $\lim_{x \rightarrow a} (f(x) + g(x)) = \lim_{x \rightarrow a} f(x) + \lim_{x \rightarrow a} g(x)$
2. **Difference** $\lim_{x \rightarrow a} (f(x) - g(x)) = \lim_{x \rightarrow a} f(x) - \lim_{x \rightarrow a} g(x)$
3. **Constant multiple** $\lim_{x \rightarrow a} (cf(x)) = c \lim_{x \rightarrow a} f(x)$
4. **Product** $\lim_{x \rightarrow a} (f(x)g(x)) = (\lim_{x \rightarrow a} f(x))(\lim_{x \rightarrow a} g(x))$
5. **Quotient** $\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \frac{\lim_{x \rightarrow a} f(x)}{\lim_{x \rightarrow a} g(x)}$, provided $\lim_{x \rightarrow a} g(x) \neq 0$
6. **Power** $\lim_{x \rightarrow a} (f(x))^n = (\lim_{x \rightarrow a} f(x))^n$
7. **Root** $\lim_{x \rightarrow a} (f(x))^{1/n} = (\lim_{x \rightarrow a} f(x))^{1/n}$, provided $f(x) > 0$, for x near a , if n is even

Proof: The proof of Law 1 is given in Example 6 of Section 2.7. The proof of Law 2 is analogous to that of Law 1; the triangle inequality in the form $|x - y| \leq |x| + |y|$ is used (Exercise 43, Section 2.7). The proof of Law 3 is outlined in Exercise 44 of Section 2.7. The proofs of Laws 4 and 5 are given below. The proof of Law 6 involves the repeated use of Law 4. Law 7 is a special case of Theorem 2.12, whose proof is given in this appendix (p. AP-2).

Proof of Product Law: Let $L = \lim_{x \rightarrow a} f(x)$ and $M = \lim_{x \rightarrow a} g(x)$. Using the definition of a limit, the goal is to show that given any $\varepsilon > 0$, it is possible to specify a $\delta > 0$ such that $|f(x)g(x) - LM| < \varepsilon$ whenever $0 < |x - a| < \delta$. Notice that

$$\begin{aligned}
 |f(x)g(x) - LM| &= |f(x)g(x) - Lg(x) + Lg(x) - LM| && \text{Add and subtract } Lg(x). \\
 &= |(f(x) - L)g(x) + (g(x) - M)L| && \text{Group terms.} \\
 &\leq |(f(x) - L)g(x)| + |(g(x) - M)L| && \text{Triangle inequality} \\
 &= |f(x) - L||g(x)| + |g(x) - M||L|. && |xy| = |x||y|
 \end{aligned}$$

- Real numbers x and y obey the triangle inequality $|x + y| \leq |x| + |y|$.

- $|g(x) - M| < 1$ implies that $g(x)$ is less than 1 unit from M . Therefore, whether $g(x)$ and M are positive or negative, $|g(x)| < |M| + 1$.

We now use the definition of the limits of f and g , and we note that L and M are fixed real numbers. Given $\varepsilon > 0$, there exist $\delta_1 > 0$ and $\delta_2 > 0$ such that

$$|f(x) - L| < \frac{\varepsilon}{2(|M| + 1)} \quad \text{and} \quad |g(x) - M| < \frac{\varepsilon}{2(|L| + 1)}$$

whenever $0 < |x - a| < \delta_1$ and $0 < |x - a| < \delta_2$, respectively. Furthermore, by the definition of the limit of g , there exists a $\delta_3 > 0$ such that $|g(x) - M| < 1$ whenever $0 < |x - a| < \delta_3$. It follows that $|g(x)| < |M| + 1$ whenever $0 < |x - a| < \delta_3$. Now take δ to be the minimum of δ_1 , δ_2 , and δ_3 . Then for $0 < |x - a| < \delta$, we have

$$\begin{aligned} |f(x)g(x) - LM| &\leq \underbrace{|f(x) - L|}_{< \frac{\varepsilon}{2(|M| + 1)}} \underbrace{|g(x)|}_{< (|M| + 1)} + \underbrace{|g(x) - M|}_{< \frac{\varepsilon}{2(|L| + 1)}} |L| \\ &< \frac{\varepsilon}{2} + \frac{\varepsilon}{2} \underbrace{\frac{|L|}{|L| + 1}}_{< 1} < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon. \end{aligned}$$

It follows that $\lim_{x \rightarrow a} (f(x)g(x)) = LM$. 

Proof of Quotient Law: We first prove that if $\lim_{x \rightarrow a} g(x) = M$ exists, where $M \neq 0$, then $\lim_{x \rightarrow a} \frac{1}{g(x)} = \frac{1}{M}$. The Quotient Law then follows when we replace g with $1/g$ in the Product Law. Therefore, the goal is to show that given any $\varepsilon > 0$, it is possible to specify a $\delta > 0$ such that $\left| \frac{1}{g(x)} - \frac{1}{M} \right| < \varepsilon$ whenever $0 < |x - a| < \delta$. First note that $M \neq 0$ and $g(x)$ can be made arbitrarily close to M . For this reason, there exists a $\delta_1 > 0$ such that $|g(x)| > |M|/2$, or equivalently, $1/|g(x)| < 2/|M|$, whenever $0 < |x - a| < \delta_1$. Furthermore, using the definition of the limit of g , given any $\varepsilon > 0$, there exists a $\delta_2 > 0$ such that $|g(x) - M| < \frac{\varepsilon|M|^2}{2}$ whenever $0 < |x - a| < \delta_2$. Now take δ to be the minimum of δ_1 and δ_2 . Then for $0 < |x - a| < \delta$, we have

- Note that if $|g(x)| > |M|/2$, then $1/|g(x)| < 2/|M|$.

$$\begin{aligned} \left| \frac{1}{g(x)} - \frac{1}{M} \right| &= \left| \frac{M - g(x)}{Mg(x)} \right| && \text{Common denominator} \\ &= \frac{1}{|M|} \underbrace{\frac{1}{|g(x)|}}_{< \frac{2}{|M|}} \underbrace{|g(x) - M|}_{< \frac{\varepsilon|M|^2}{2}} && \text{Rewrite.} \\ &< \frac{1}{|M|} \frac{2}{|M|} \frac{\varepsilon|M|^2}{2} = \varepsilon. && \text{Simplify.} \end{aligned}$$

By the definition of a limit, we have $\lim_{x \rightarrow a} \frac{1}{g(x)} = \frac{1}{M}$. The proof can be completed by applying the Product Law with g replaced with $1/g$.

THEOREM 2.12 Limits of Composite Functions

1. If g is continuous at a and f is continuous at $g(a)$, then

$$\lim_{x \rightarrow a} f(g(x)) = f(\lim_{x \rightarrow a} g(x)).$$

2. If $\lim_{x \rightarrow a} g(x) = L$ and f is continuous at L , then

$$\lim_{x \rightarrow a} f(g(x)) = f(\lim_{x \rightarrow a} g(x)).$$

Proof: Part 1 was proved in Section 2.6 (it is also a direct consequence of Part 2). Let $\varepsilon > 0$ be given. We need to show that there exists $\delta > 0$ such that $|f(g(x)) - f(L)| < \varepsilon$ whenever $0 < |x - a| < \delta$. Because f is continuous at L , there exists $\delta_1 > 0$ such that

$$|f(y) - f(L)| < \varepsilon \text{ whenever } |y - L| < \delta_1.$$

We also know that $\lim_{x \rightarrow a} g(x) = L$, so there exists $\delta > 0$ such that

$$|g(x) - L| < \delta_1 \text{ whenever } 0 < |x - a| < \delta.$$

Combining these results, if $0 < |x - a| < \delta$, then $|g(x) - L| < \delta_1$, and the inequality $|g(x) - L| < \delta_1$ implies that $|f(g(x)) - f(L)| < \varepsilon$. Therefore, $|f(g(x)) - f(L)| < \varepsilon$ whenever $0 < |x - a| < \delta$. 

THEOREM 10.20 Ratio Test

Let $\sum a_k$ be an infinite series, and let $r = \lim_{k \rightarrow \infty} \left| \frac{a_{k+1}}{a_k} \right|$.

1. If $r < 1$, the series converges absolutely, and therefore it converges (Theorem 10.19).
2. If $r > 1$ (including $r = \infty$), the series diverges.
3. If $r = 1$, the test is inconclusive.

Proof: We consider three cases: $r < 1$, $r > 1$, and $r = 1$.

1. Assume $r < 1$ and choose a number R such that $r < R < 1$. Because the sequence

$\left\{ \left| \frac{a_{k+1}}{a_k} \right| \right\}$ converges to a number r less than R , eventually all the terms in the tail of the sequence $\left\{ \left| \frac{a_{k+1}}{a_k} \right| \right\}$ are less than R . That is, there is a positive integer N such

that $\left| \frac{a_{k+1}}{a_k} \right| < R$, for all $k > N$. Multiplying both sides of this inequality by $\frac{|a_k|}{R^{k+1}}$,

we have $\frac{|a_{k+1}|}{R^{k+1}} < \frac{|a_k|}{R^k}$, for all $k > N$. So the sequence $\left\{ \frac{|a_k|}{R^k} \right\}_{k=N+1}^{\infty}$ is decreasing

and it follows that $\frac{|a_k|}{R^k} < \frac{|a_{N+1}|}{R^{N+1}}$, for all $k \geq N + 1$. By letting $c = \frac{|a_{N+1}|}{R^{N+1}}$, we have

$0 < |a_k| \leq cR^k$, for all $k \geq N + 1$. Let S_n represent the n th partial sum of $\sum_{k=N+1}^{\infty} |a_k|$;

note that the partial sums of this series are bounded by a convergent geometric series:

$$\begin{aligned} S_n &= |a_{N+1}| + |a_{N+2}| + \cdots + |a_{N+n}| \\ &\leq cR^{N+1} + cR^{N+2} + \cdots + cR^{N+n} \\ &< cR^{N+1} + cR^{N+2} + \cdots + cR^{N+n} + \cdots \\ &= \frac{cR^{N+1}}{1 - R}. \end{aligned}$$

Because the sequence $\{S_n\}$ is increasing (each partial sum in the sequence consists of positive terms) and is bounded above by $\frac{cR^{N+1}}{1 - R}$, it converges by the Bounded Monotonic Sequences Theorem (Theorem 10.5). Therefore, $\sum_{k=N+1}^{\infty} |a_k|$ converges and we conclude that $\sum_{k=1}^{\infty} |a_k|$ converges (Theorem 10.8), which in turn implies that $\sum_{k=1}^{\infty} a_k$ converges (Theorem 10.19).

2. If $r > 1$, there is a positive integer N for which $\left| \frac{a_{k+1}}{a_k} \right| > 1$, or equivalently $|a_{k+1}| > |a_k|$, for all $k > N$. So every term in the sequence $\{|a_k|\}_{k=N+1}^{\infty}$ is greater than or equal to the positive number $|a_{N+1}|$, which implies that $\lim_{n \rightarrow \infty} a_n \neq 0$. Therefore, the series $\sum_{k=N+1}^{\infty} a_k$ diverges by the Divergence Test, and we conclude that $\sum_{k=1}^{\infty} a_k$ diverges (Theorem 10.8).
3. In the case that $r = 1$, the series $\sum_{k=1}^{\infty} a_k$ may or may not converge. For example, both the divergent harmonic series $\sum_{k=1}^{\infty} \frac{1}{k}$ and the convergent p -series $\sum_{k=1}^{\infty} \frac{1}{k^2}$ produce a value of $r = 1$. 

THEOREM 10.21 Root Test

Let $\sum a_k$ be an infinite series, and let $\rho = \lim_{k \rightarrow \infty} \sqrt[k]{|a_k|}$.

1. If $\rho < 1$, the series converges absolutely, and therefore it converges (Theorem 10.19).
2. If $\rho > 1$ (including $\rho = \infty$), the series diverges.
3. If $\rho = 1$, the test is inconclusive.

Proof: We consider three cases: $\rho < 1$, $\rho > 1$, and $\rho = 1$.

1. Assume $\rho < 1$ and choose a number R such that $\rho < R < 1$. Because the sequence $\{\sqrt[k]{|a_k|}\}$ converges to a number less than R , there is a positive integer N such that $\sqrt[k]{|a_k|} < R$, or equivalently $|a_k| < R^k$, for all $k > N$. Let S_n represent the n th partial sum of $\sum_{k=N+1}^{\infty} |a_k|$; note that the partial sums of this series are bounded by a convergent geometric series:

$$\begin{aligned} S_n &= |a_{N+1}| + |a_{N+2}| + \cdots + |a_{N+n}| \\ &\leq R^{N+1} + R^{N+2} + \cdots + R^{N+n} \\ &< R^{N+1} + R^{N+2} + \cdots + R^{N+n} + \cdots \\ &= \frac{R^{N+1}}{1 - R}. \end{aligned}$$

Because the sequence $\{S_n\}$ is nondecreasing (each partial sum in the sequence consists of nonnegative terms) and is bounded above by $\frac{R^{N+1}}{1 - R}$, it converges by the Bounded Monotonic Sequences Theorem (Theorem 10.5). Therefore, $\sum_{k=N+1}^{\infty} |a_k|$ converges, and we conclude that $\sum_{k=1}^{\infty} |a_k|$ converges (Theorem 10.8), which in turn implies that $\sum_{k=1}^{\infty} a_k$ converges (Theorem 10.19).

2. If $\rho > 1$, there is an integer N for which $\sqrt[k]{|a_k|} > 1$, or equivalently $|a_k| > 1$, for all $k > N$. So every term in the sequence $\{|a_k|\}_{k=N+1}^{\infty}$ is greater than or equal to 1, which implies that $\lim_{n \rightarrow \infty} a_n \neq 0$. Therefore, the series $\sum_{k=N+1}^{\infty} a_k$ diverges by the Divergence Test, and we conclude that $\sum_{k=1}^{\infty} a_k$ diverges (Theorem 10.8).
3. If $\rho = 1$, the series $\sum_{k=1}^{\infty} a_k$ may or may not converge. For example, both the divergent harmonic series $\sum_{k=1}^{\infty} \frac{1}{k}$ and the convergent p -series $\sum_{k=1}^{\infty} \frac{1}{k^2}$ produce a value of $\rho = 1$. 

THEOREM 11.3 Convergence of Power Series

A power series $\sum_{k=0}^{\infty} c_k(x - a)^k$ centered at a converges in one of three ways:

1. The series converges absolutely for all x . It follows, by Theorem 10.19, that the series converges, in which case the interval of convergence is $(-\infty, \infty)$ and the radius of convergence is $R = \infty$.
2. There is a real number $R > 0$ such that the series converges absolutely (and therefore converges) for $|x - a| < R$ and diverges for $|x - a| > R$, in which case the radius of convergence is R .
3. The series converges only at a , in which case the radius of convergence is $R = 0$.

Proof: Without loss of generality, we take $a = 0$. (If $a \neq 0$, the following argument may be shifted so it is centered at $x = a$.) The proof hinges on a preliminary result:

If $\sum_{k=0}^{\infty} c_k x^k$ converges for $x = b \neq 0$, then it converges absolutely, for

$|x| < |b|$. If $\sum_{k=0}^{\infty} c_k x^k$ diverges for $x = d$, then it diverges, for $|x| > |d|$.

To prove these facts, assume that $\sum_{k=0}^{\infty} c_k b^k$ converges, which implies that $\lim_{k \rightarrow \infty} c_k b^k = 0$.

Then there exists a real number $M > 0$ such that $|c_k b^k| < M$, for $k = 0, 1, 2, 3, \dots$. It follows that

$$\sum_{k=0}^{\infty} |c_k x^k| = \sum_{k=0}^{\infty} \underbrace{|c_k b^k|}_{< M} \left| \frac{x}{b} \right|^k < M \sum_{k=0}^{\infty} \left| \frac{x}{b} \right|^k.$$

If $|x| < |b|$, then $|x/b| < 1$ and $\sum_{k=0}^{\infty} \left| \frac{x}{b} \right|^k$ is a convergent geometric series. Therefore, $\sum_{k=0}^{\infty} |c_k x^k|$ converges by the comparison test, which implies that $\sum_{k=0}^{\infty} c_k x^k$ converges absolutely for $|x| < |b|$. The second half of the preliminary result is proved by supposing the series diverges at $x = d$. The series cannot converge at a point x_0 with $|x_0| > |d|$ because by the preceding argument, it would converge for $|x| < |x_0|$, which includes $x = d$. Therefore, the series diverges for $|x| > |d|$.

Now we may deal with the three cases in the theorem. Let S be the set of real numbers for which the series converges, which always includes 0. If $S = \{0\}$, then we have Case 3. If S consists of all real numbers, then we have Case 1. For Case 2, assume that $d \neq 0$ is a point at which the series diverges. By the preliminary result, the series diverges for $|x| > |d|$. Therefore, if x is in S , then $|x| < |d|$, which implies that S is bounded. By the Least Upper Bound Property for real numbers, S has a least upper bound R , such that $x \leq R$, for all x in S . If $|x| > R$, then x is not in S and the series diverges. If $|x| < R$, then x is not the least upper bound of S and there exists a number b in S with $|x| < b \leq R$.

Because the series converges at $x = b$, by the preliminary result, $\sum_{k=0}^{\infty} |c_k x^k|$ converges for $|x| < |b|$. Therefore, the series $\sum_{k=0}^{\infty} c_k x^k$ converges absolutely (which, by Theorem 10.19, implies the series converges) for $|x| < R$ and diverges for $|x| > R$.

► The Least Upper Bound Property for real numbers states that if a nonempty set S is bounded (that is, there exists a number M , called an *upper bound*, such that $x \leq M$ for all x in S), then S has a *least upper bound* L , which is the smallest of the upper bounds.

THEOREM 12.3 Eccentricity-Directrix Theorem

Suppose ℓ is a line, F is a point not on ℓ , and e is a positive real number. Let C be

the set of points P in a plane with the property that $\frac{|PF|}{|PL|} = e$, where $|PL|$ is the perpendicular distance from P to ℓ .

1. If $e = 1$, C is a **parabola**.
2. If $0 < e < 1$, C is an **ellipse**.
3. If $e > 1$, C is a **hyperbola**.

Figure A.1

Proof: If $e = 1$, then the defining property becomes $|PF| = |PL|$, which is the standard definition of a parabola (Section 12.4). We prove the result for ellipses ($0 < e < 1$); a small modification handles the case of hyperbolas ($e > 1$).

Let E be the curve whose points satisfy $|PF| = e|PL|$ and suppose $0 < e < 1$; the goal is to show that E is an ellipse. There are two points on the x -axis (the *vertices*), call them V and V' , that satisfy $|VF| = e|VL|$ and $|V'F| = e|V'L|$. (Note that $|VL|$ is the perpendicular distance from V to the line ℓ , not the distance from the points labeled V and L in Figure A.1. $|V'L|$ should also be interpreted in this way.) We choose the origin such that V and V' have coordinates $(a, 0)$ and $(-a, 0)$, respectively (Figure A.1). We locate the point F (a *focus*) at $(c, 0)$ and let ℓ (a *directrix*) be the line $x = d$, where $c > 0$ and $d > 0$. These choices place the center of E at the origin. Notice that we have four parameters (a, c, d , and e) that must be related.

Because the vertex $V(a, 0)$ is on E , it satisfies the defining property $|PF| = e|PL|$, with $P = V$. This condition implies that $a - c = e(d - a)$. Because the vertex $V'(-a, 0)$ is on the curve E , it also satisfies the defining property $|PF| = e|PL|$, with $P = V'$. This condition implies that $a + c = e(d + a)$. Solving these two equations for c and d , we find that $c = ae$ and $d = a/e$. To summarize, the parameters a, c, d , and e are related by the equations

$$c = ae \quad \text{and} \quad a = de.$$

Because $e < 1$, it follows that $c < a < d$.

We now use the property $|PF| = e|PL|$ with an arbitrary point $P(x, y)$ on the curve E . Figure A.1 shows the geometry with the focus $(c, 0) = (ae, 0)$ and the directrix $x = d = a/e$. The condition $|PF| = e|PL|$ becomes

$$\sqrt{(x - ae)^2 + y^2} = e\left(\frac{a}{e} - x\right).$$

The goal is to find the simplest possible relationship between x and y . Squaring both sides and collecting terms, we have

$$(1 - e^2)x^2 + y^2 = a^2(1 - e^2).$$

Dividing through by $a^2(1 - e^2)$ gives the equation of the standard ellipse:

$$\frac{x^2}{a^2} + \frac{y^2}{a^2(1 - e^2)} = \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1, \quad \text{where} \quad b^2 = a^2(1 - e^2).$$

This is the equation of an ellipse centered at the origin with vertices and foci on the x -axis.

The preceding proof is now applied with $e > 1$. The argument for ellipses with $0 < e < 1$ led to the equation

$$\frac{x^2}{a^2} + \frac{y^2}{a^2(1 - e^2)} = 1.$$

With $e > 1$, we have $1 - e^2 < 0$, so we write $(1 - e^2) = -(e^2 - 1)$. The resulting equation describes a hyperbola centered at the origin with the foci on the x -axis:

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1, \quad \text{where} \quad b^2 = a^2(e^2 - 1).$$

THEOREM 15.3 Continuity of Composite Functions

If $u = g(x, y)$ is continuous at (a, b) and $z = f(u)$ is continuous at $g(a, b)$, then the composite function $z = f(g(x, y))$ is continuous at (a, b) .

Proof: Let P and P_0 represent the points (x, y) and (a, b) , respectively. Let $u = g(P)$ and $u_0 = g(P_0)$. The continuity of f at u_0 means that $\lim_{u \rightarrow u_0} f(u) = f(u_0)$. This limit implies that given any $\varepsilon > 0$, there exists a $\delta^* > 0$ such that

$$|f(u) - f(u_0)| < \varepsilon \quad \text{whenever} \quad 0 < |u - u_0| < \delta^*.$$

The continuity of g at P_0 means that $\lim_{P \rightarrow P_0} g(P) = g(P_0)$. Letting $|P - P_0|$ denote the distance between P and P_0 , this limit implies that given any $\delta^* > 0$, there exists a $\delta > 0$ such that

$$|g(P) - g(P_0)| = |u - u_0| < \delta^* \quad \text{whenever} \quad 0 < |P - P_0| < \delta.$$

We now combine these two statements. Given any $\varepsilon > 0$, there exists a $\delta > 0$ such that

$$|f(g(P)) - f(g(P_0))| = |f(u) - f(u_0)| < \varepsilon \quad \text{whenever} \quad 0 < |P - P_0| < \delta.$$

Therefore, $\lim_{(x,y) \rightarrow (a,b)} f(g(x, y)) = f(g(a, b))$ and $z = f(g(x, y))$ is continuous at (a, b) . ▶

THEOREM 15.5 Conditions for Differentiability

Suppose the function f has partial derivatives f_x and f_y defined on an open set containing (a, b) , with f_x and f_y continuous at (a, b) . Then f is differentiable at (a, b) .

Figure A.2

Proof: Figure A.2 shows a region on which the conditions of the theorem are satisfied containing the points $P_0(a, b)$, $Q(a + \Delta x, b)$, and $P(a + \Delta x, b + \Delta y)$. By the definition of differentiability of f at P_0 , we must show that

$$\Delta z = f(P) - f(P_0) = f_x(a, b)\Delta x + f_y(a, b)\Delta y + \varepsilon_1\Delta x + \varepsilon_2\Delta y,$$

where ε_1 and ε_2 depend only on $a, b, \Delta x$, and Δy , with $(\varepsilon_1, \varepsilon_2) \rightarrow (0, 0)$ as $(\Delta x, \Delta y) \rightarrow (0, 0)$. We can view the change Δz taking place in two stages:

- $\Delta z_1 = f(a + \Delta x, b) - f(a, b)$ is the change in z as (x, y) moves from P_0 to Q .
- $\Delta z_2 = f(a + \Delta x, b + \Delta y) - f(a + \Delta x, b)$ is the change in z as (x, y) moves from Q to P .

Applying the Mean Value Theorem to the first variable and noting that f is differentiable with respect to x , we have

$$\Delta z_1 = f(a + \Delta x, b) - f(a, b) = f_x(c, b)\Delta x,$$

where c lies in the interval $(a, a + \Delta x)$. Similarly, applying the Mean Value Theorem to the second variable and noting that f is differentiable with respect to y , we have

$$\Delta z_2 = f(a + \Delta x, b + \Delta y) - f(a + \Delta x, b) = f_y(a + \Delta x, d)\Delta y,$$

where d lies in the interval $(b, b + \Delta y)$. We now express Δz as the sum of Δz_1 and Δz_2 :

$$\begin{aligned} \Delta z &= \Delta z_1 + \Delta z_2 \\ &= f_x(c, b)\Delta x + f_y(a + \Delta x, d)\Delta y \\ &= \underbrace{(f_x(c, b) - f_x(a, b))}_{\varepsilon_1} \Delta x + f_x(a, b)\Delta x && \text{Add and subtract } f_x(a, b). \\ &\quad + \underbrace{(f_y(a + \Delta x, d) - f_y(a, b))}_{\varepsilon_2} \Delta y + f_y(a, b)\Delta y && \text{Add and subtract } f_y(a, b). \\ &= (f_x(a, b) + \varepsilon_1)\Delta x + (f_y(a, b) + \varepsilon_2)\Delta y. \end{aligned}$$

Note that as $\Delta x \rightarrow 0$ and $\Delta y \rightarrow 0$, we have $c \rightarrow a$ and $d \rightarrow b$. Because f_x and f_y are continuous at (a, b) , it follows that as $\Delta x \rightarrow 0$ and $\Delta y \rightarrow 0$,

$$\varepsilon_1 = f_x(c, b) - f_x(a, b) \rightarrow 0 \quad \text{and} \quad \varepsilon_2 = f_y(a + \Delta x, d) - f_y(a, b) \rightarrow 0.$$

Therefore, the condition for differentiability of f at (a, b) has been proved. 

THEOREM 15.7 Chain Rule (One Independent Variable)

Let $z = f(x, y)$ be a differentiable function of x and y on its domain, where x and y are differentiable functions of t on an interval I . Then

$$\frac{dz}{dt} = \frac{\partial f}{\partial x} \frac{dx}{dt} + \frac{\partial f}{\partial y} \frac{dy}{dt}.$$

Proof: Assume $(a, b) = (x(t), y(t))$ is in the domain of f , where t is in I . Let $\Delta x = x(t + \Delta t) - x(t)$ and $\Delta y = y(t + \Delta t) - y(t)$. Because f is differentiable at (a, b) , we know (Section 15.3) that

$$\Delta z = \frac{\partial f}{\partial x}(a, b)\Delta x + \frac{\partial f}{\partial y}(a, b)\Delta y + \varepsilon_1\Delta x + \varepsilon_2\Delta y,$$

where $(\varepsilon_1, \varepsilon_2) \rightarrow (0, 0)$ as $(\Delta x, \Delta y) \rightarrow (0, 0)$. Dividing this equation by Δt gives

$$\frac{\Delta z}{\Delta t} = \frac{\partial f}{\partial x} \frac{\Delta x}{\Delta t} + \frac{\partial f}{\partial y} \frac{\Delta y}{\Delta t} + \varepsilon_1 \frac{\Delta x}{\Delta t} + \varepsilon_2 \frac{\Delta y}{\Delta t}.$$

As $\Delta t \rightarrow 0$, several things occur. First, because $x = g(t)$ and $y = h(t)$ are differentiable on I , $\frac{\Delta x}{\Delta t}$ and $\frac{\Delta y}{\Delta t}$ approach $\frac{dx}{dt}$ and $\frac{dy}{dt}$, respectively. Similarly, $\frac{\Delta z}{\Delta t}$ approaches $\frac{dz}{dt}$ as $\Delta t \rightarrow 0$. The fact that x and y are continuous on I (because they are differentiable there) means that $\Delta x \rightarrow 0$ and $\Delta y \rightarrow 0$ as $\Delta t \rightarrow 0$. Therefore, because $(\varepsilon_1, \varepsilon_2) \rightarrow (0, 0)$ as $(\Delta x, \Delta y) \rightarrow (0, 0)$, it follows that $(\varepsilon_1, \varepsilon_2) \rightarrow (0, 0)$ as $\Delta t \rightarrow 0$. Letting $\Delta t \rightarrow 0$, we have

$$\lim_{\Delta t \rightarrow 0} \frac{\Delta z}{\Delta t} = \frac{\partial f}{\partial x} \lim_{\Delta t \rightarrow 0} \frac{\Delta x}{\Delta t} + \frac{\partial f}{\partial y} \lim_{\Delta t \rightarrow 0} \frac{\Delta y}{\Delta t} + \lim_{\Delta t \rightarrow 0} \underbrace{\varepsilon_1}_{\rightarrow 0} \underbrace{\frac{\Delta x}{\Delta t}}_{\rightarrow \frac{dx}{dt}} + \lim_{\Delta t \rightarrow 0} \underbrace{\varepsilon_2}_{\rightarrow 0} \underbrace{\frac{\Delta y}{\Delta t}}_{\rightarrow \frac{dy}{dt}}$$

$\frac{dz}{dt} \qquad \frac{dx}{dt} \qquad \frac{dy}{dt} \qquad \frac{dx}{dt} \qquad \frac{dy}{dt}$

or

$$\frac{dz}{dt} = \frac{\partial f}{\partial x} \frac{dx}{dt} + \frac{\partial f}{\partial y} \frac{dy}{dt}.$$

THEOREM 15.15 Second Derivative Test

Suppose the second partial derivatives of f are continuous throughout an open disk centered at the point (a, b) , where $f_x(a, b) = f_y(a, b) = 0$. Let $D(x, y) = f_{xx}(x, y)f_{yy}(x, y) - (f_{xy}(x, y))^2$.

1. If $D(a, b) > 0$ and $f_{xx}(a, b) < 0$, then f has a local maximum value at (a, b) .
2. If $D(a, b) > 0$ and $f_{xx}(a, b) > 0$, then f has a local minimum value at (a, b) .
3. If $D(a, b) < 0$, then f has a saddle point at (a, b) .
4. If $D(a, b) = 0$, then the test is inconclusive.

Figure A.3

Proof: The proof relies on a two-variable version of Taylor's Theorem, which we prove first. Figure A.3 shows the open disk R on which the conditions of Theorem 15.15 are satisfied; it contains the points $P_0(a, b)$ and $P(a + \Delta x, b + \Delta y)$. The line ℓ through P_0 and P has a parametric description

$$\langle x(t), y(t) \rangle = \langle a + t\Delta x, b + t\Delta y \rangle,$$

where $t = 0$ corresponds to P_0 and $t = 1$ corresponds to P .

We now let $F(t) = f(a + t\Delta x, b + t\Delta y)$ be the value of f along that part of ℓ that lies in R . By the Chain Rule, we have

$$F'(t) = f_x \underbrace{x'(t)}_{\Delta x} + f_y \underbrace{y'(t)}_{\Delta y} = f_x \Delta x + f_y \Delta y.$$

Differentiating again with respect to t (f_x and f_y are differentiable), we use $f_{xy} = f_{yx}$ to obtain

$$\begin{aligned} F''(t) &= \frac{\partial F'}{\partial x} \underbrace{x'(t)}_{\Delta x} + \frac{\partial F'}{\partial y} \underbrace{y'(t)}_{\Delta y} \\ &= \frac{\partial}{\partial x} (f_x \Delta x + f_y \Delta y) \Delta x + \frac{\partial}{\partial y} (f_x \Delta x + f_y \Delta y) \Delta y \\ &= f_{xx} \Delta x^2 + 2f_{xy} \Delta x \Delta y + f_{yy} \Delta y^2. \end{aligned}$$

Noting that F meets the conditions of Taylor's Theorem for one variable with $n = 1$, we write

$$F(t) = F(0) + F'(0)(t - 0) + \frac{1}{2} F''(c)(t - 0)^2,$$

where c is between 0 and t . Setting $t = 1$, it follows that

$$F(1) = F(0) + F'(0) + \frac{1}{2} F''(c),$$

where $0 < c < 1$. Recalling that $F(t) = f(a + t\Delta x, b + t\Delta y)$ and invoking the condition $f_x(a, b) = f_y(a, b) = 0$, we have

$$\begin{aligned} F(1) &= f(a + \Delta x, b + \Delta y) \\ &= f(a, b) + \underbrace{f_x(a, b)\Delta x + f_y(a, b)\Delta y}_{F'(0) = 0} \\ &\quad + \frac{1}{2} (f_{xx} \Delta x^2 + 2f_{xy} \Delta x \Delta y + f_{yy} \Delta y^2) \Big|_{(a+c\Delta x, b+c\Delta y)} \\ &= f(a, b) + \frac{1}{2} \underbrace{(f_{xx} \Delta x^2 + 2f_{xy} \Delta x \Delta y + f_{yy} \Delta y^2) \Big|_{(a+c\Delta x, b+c\Delta y)}}_{H(c)} \\ &= f(a, b) + \frac{1}{2} H(c). \end{aligned}$$

The existence and type of extreme point at (a, b) are determined by the sign of $f(a + \Delta x, b + \Delta y) - f(a, b)$ (for example, if $f(a + \Delta x, b + \Delta y) - f(a, b) \geq 0$ for all Δx and Δy near 0, then f has a local minimum at (a, b)). Note that $f(a + \Delta x, b + \Delta y) - f(a, b)$ has the same sign as the quantity we have denoted $H(c)$. Assuming $H(0) \neq 0$, for Δx and Δy sufficiently small and nonzero, the sign of $H(c)$ is the same as the sign of

$$H(0) = f_{xx}(a, b)\Delta x^2 + 2f_{xy}(a, b)\Delta x \Delta y + f_{yy}(a, b)\Delta y^2$$

(because the second partial derivatives are continuous at (a, b) and $(a + c\Delta x, b + c\Delta y)$ can be made arbitrarily close to (a, b)). Multiplying both sides of the previous expression by f_{xx} and rearranging terms leads to

$$\begin{aligned} f_{xx} H(0) &= f_{xx}^2 \Delta x^2 + 2f_{xy} f_{xx} \Delta x \Delta y + f_{yy} f_{xx} \Delta y^2 \\ &= \underbrace{(f_{xx} \Delta x + f_{xy} \Delta y)^2}_{\geq 0} + \underbrace{(f_{xx} f_{yy} - f_{xy}^2) \Delta y^2}_D, \end{aligned}$$

where all derivatives are evaluated at (a, b) . Recall that the signs of $H(0)$ and $f(a + \Delta x, b + \Delta y) - f(a, b)$ are the same. Letting $D(a, b) = (f_{xx} f_{yy} - f_{xy}^2)|_{(a, b)}$, we reach the following conclusions:

- If $D(a, b) > 0$ and $f_{xx}(a, b) < 0$, then $H(0) < 0$ (for Δx and Δy sufficiently close to 0) and $f(a + \Delta x, b + \Delta y) - f(a, b) < 0$. Therefore, f has a local maximum value at (a, b) .
- If $D(a, b) > 0$ and $f_{xx}(a, b) > 0$, then $H(0) > 0$ (for Δx and Δy sufficiently close to 0) and $f(a + \Delta x, b + \Delta y) - f(a, b) > 0$. Therefore, f has a local minimum value at (a, b) .
- If $D(a, b) < 0$, then $H(0) > 0$ for some small nonzero values of Δx and Δy (implying $f(a + \Delta x, b + \Delta y) > f(a, b)$), and $H(0) < 0$ for other small nonzero values of Δx and Δy (implying $f(a + \Delta x, b + \Delta y) < f(a, b)$). (The relative sizes of $(f_{xx} \Delta x + f_{xy} \Delta y)^2$ and $(f_{xx} f_{yy} - f_{xy}^2) \Delta y^2$ can be adjusted by varying Δx and Δy .) Therefore, f has a saddle point at (a, b) .
- If $D(a, b) = 0$, then $H(0)$ may be zero, in which case the sign of $H(c)$ cannot be determined. Therefore, the test is inconclusive. 

B

Appendix

The goal of this appendix is to establish the notation, terminology, and algebraic skills that are essential when learning calculus.

Algebra

EXAMPLE 1 Algebra review

- Evaluate $(-32)^{2/5}$.
- Simplify $\frac{1}{x-2} - \frac{1}{x+2}$.
- Solve the equation $\frac{x^4 - 5x^2 + 4}{x-1} = 0$.

SOLUTION

- Recall that $(-32)^{2/5} = ((-32)^{1/5})^2$. Because $(-32)^{1/5} = \sqrt[5]{-32} = -2$, we have $(-32)^{2/5} = (-2)^2 = 4$.

Another option is to write $(-32)^{2/5} = ((-32)^2)^{1/5} = 1024^{1/5} = 4$.

- Finding a common denominator and simplifying leads to

$$\frac{1}{x-2} - \frac{1}{x+2} = \frac{(x+2) - (x-2)}{(x-2)(x+2)} = \frac{4}{x^2 - 4}.$$

- Notice that $x = 1$ cannot be a solution of the equation because the left side of the equation is undefined at $x = 1$. Because $x - 1 \neq 0$, both sides of the equation can be multiplied by $x - 1$ to produce $x^4 - 5x^2 + 4 = 0$. After factoring, this equation becomes $(x^2 - 4)(x^2 - 1) = 0$, which implies $x^2 - 4 = (x - 2)(x + 2) = 0$ or $x^2 - 1 = (x - 1)(x + 1) = 0$. The roots of $x^2 - 4 = 0$ are $x = \pm 2$, and the roots of $x^2 - 1 = 0$ are $x = \pm 1$. Excluding $x = 1$, the roots of the original equation are $x = -1$ and $x = \pm 2$.

Related Exercises 15, 20, 22 ◀

Sets of Real Numbers

Figure B.1 shows the notation for **open intervals**, **closed intervals**, and various **bounded** and **unbounded intervals**. Notice that either interval notation or set notation may be used.

	$[a, b] = \{x: a \leq x \leq b\}$	Closed, bounded interval
	$(a, b] = \{x: a < x \leq b\}$	Bounded interval
	$[a, b) = \{x: a \leq x < b\}$	Bounded interval
	$(a, b) = \{x: a < x < b\}$	Open, bounded interval
	$[a, \infty) = \{x: x \geq a\}$	Unbounded interval
	$(a, \infty) = \{x: x > a\}$	Unbounded interval
	$(-\infty, b] = \{x: x \leq b\}$	Unbounded interval
	$(-\infty, b) = \{x: x < b\}$	Unbounded interval
	$(-\infty, \infty) = \{x: -\infty < x < \infty\}$	Unbounded interval

Figure B.1

EXAMPLE 2 Solving inequalities Solve the following inequalities.

a. $-x^2 + 5x - 6 < 0$ b. $\frac{x^2 - x - 2}{x - 3} \leq 0$

SOLUTION

a. We multiply by -1 , reverse the inequality, and then factor:

$$\begin{aligned} x^2 - 5x + 6 &> 0 && \text{Multiply by } -1. \\ (x - 2)(x - 3) &> 0. && \text{Factor.} \end{aligned}$$

The roots of the corresponding equation $(x - 2)(x - 3) = 0$ are $x = 2$ and $x = 3$. These roots partition the number line (Figure B.2) into three intervals: $(-\infty, 2)$, $(2, 3)$, and $(3, \infty)$. On each interval, the product $(x - 2)(x - 3)$ does not change sign. To determine the sign of the product on a given interval, a **test value** x is selected and the sign of $(x - 2)(x - 3)$ is determined at x .

Figure B.2

A convenient choice for x in $(-\infty, 2)$ is $x = 0$. At this test value,

$$(x - 2)(x - 3) = (-2)(-3) > 0.$$

Using a test value of $x = 2.5$ in the interval $(2, 3)$, we have

$$(x - 2)(x - 3) = (0.5)(-0.5) < 0.$$

A test value of $x = 4$ in $(3, \infty)$ gives

$$(x - 2)(x - 3) = (2)(1) > 0.$$

Therefore, $(x - 2)(x - 3) > 0$ on $(-\infty, 2)$ and $(3, \infty)$. We conclude that the inequality $-x^2 + 5x - 6 < 0$ is satisfied for all x in either $(-\infty, 2)$ or $(3, \infty)$ (Figure B.2).

► The set of numbers $\{x: x \text{ is in } (-\infty, 2) \text{ or } (3, \infty)\}$ may also be expressed using the union symbol:

$$(-\infty, 2) \cup (3, \infty).$$

- b. The expression $\frac{x^2 - x - 2}{x - 3}$ can change sign only at points where the numerator or denominator of $\frac{x^2 - x - 2}{x - 3}$ equals 0. Because

$$\frac{x^2 - x - 2}{x - 3} = \frac{(x + 1)(x - 2)}{x - 3},$$

the numerator is 0 when $x = -1$ or $x = 2$, and the denominator is 0 at $x = 3$.

Therefore, we examine the sign of $\frac{(x + 1)(x - 2)}{x - 3}$ on the intervals $(-\infty, -1)$, $(-1, 2)$, $(2, 3)$, and $(3, \infty)$.

Using test values on these intervals, we see that $\frac{(x + 1)(x - 2)}{x - 3} < 0$ on $(-\infty, -1)$ and $(2, 3)$. Furthermore, the expression is 0 when $x = -1$ and $x = 2$.

Therefore, $\frac{x^2 - x - 2}{x - 3} \leq 0$ for all values of x in either $(-\infty, -1]$ or $[2, 3)$.

(Figure B.3).

Test Value	$x + 1$	$x - 2$	$x - 3$	Result
-2	-	-	-	-
0	+	-	-	+
2.5	+	+	-	-
4	+	+	+	+

Figure B.3

Related Exercises 27, 29 ◀

Absolute Value

The **absolute value** of a real number x , denoted $|x|$, is the distance between x and the origin on the number line (Figure B.4). More generally, $|x - y|$ is the distance between the points x and y on the number line. The absolute value has the following definition and properties.

- The absolute value is useful in simplifying square roots. Because $\sqrt{a}$ is nonnegative, we have $\sqrt{a^2} = |a|$. For example, $\sqrt{3^2} = 3$ and $\sqrt{(-3)^2} = \sqrt{9} = 3$. Note that the solutions of $x^2 = 9$ are $|x| = 3$ or $x = \pm 3$.

Figure B.4

Definition and Properties of the Absolute Value

The absolute value of a real number x is defined as

$$|x| = \begin{cases} x & \text{if } x \geq 0 \\ -x & \text{if } x < 0. \end{cases}$$

Let a be a positive real number.

- $|x| = a \Leftrightarrow x = \pm a$
- $|x| < a \Leftrightarrow -a < x < a$
- $|x| > a \Leftrightarrow x > a \text{ or } x < -a$
- $|x| \leq a \Leftrightarrow -a \leq x \leq a$
- $|x| \geq a \Leftrightarrow x \geq a \text{ or } x \leq -a$
- $|x + y| \leq |x| + |y|$

- Property 6 is called the **triangle inequality**.

EXAMPLE 3 Inequalities with absolute values Solve the following inequalities. Then sketch the solution on the number line and express it in interval notation.

a. $|x - 2| < 3$ b. $|2x - 6| \geq 10$

SOLUTION

a. Using property 2 of the absolute value, $|x - 2| < 3$ is written as

$$-3 < x - 2 < 3.$$

Adding 2 to each term of these inequalities results in $-1 < x < 5$ (Figure B.5). This set of numbers is written as $(-1, 5)$ in interval notation.

b. Using property 5, the inequality $|2x - 6| \geq 10$ implies that

$$2x - 6 \geq 10 \quad \text{or} \quad 2x - 6 \leq -10.$$

We add 6 to both sides of the first inequality to obtain $2x \geq 16$, which implies $x \geq 8$. Similarly, the second inequality yields $x \leq -2$ (Figure B.6). In interval notation, the solution is $(-\infty, -2] \cup [8, \infty)$.

Related Exercise 31 ◀

Figure B.5

Figure B.6

Cartesian Coordinate System

The conventions of the **Cartesian coordinate system** or **xy-coordinate system** are illustrated in Figure B.7. The set of real numbers is often denoted $\mathbb{R}$. The set of all ordered pairs of real numbers, which constitute the xy -plane, is often denoted $\mathbb{R}^2$.

- The familiar (x, y) coordinate system is named after René Descartes (1596–1650). However, it was introduced independently and simultaneously by Pierre de Fermat (1601–1665).

Figure B.7

Distance Formula and Circles

By the Pythagorean theorem (Figure B.8), we have the following formula for the distance between two points $P_1(x_1, y_1)$ and $P_2(x_2, y_2)$.

Distance Formula

The distance between the points $P_1(x_1, y_1)$ and $P_2(x_2, y_2)$ is

$$|P_1P_2| = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}.$$

A **circle** is the set of points in the plane whose distance from a fixed point (the **center**) is constant (the **radius**). This definition leads to the following equations that describe a circle.

Figure B.8

Figure B.9

Equation of a Circle

The equation of a circle centered at (a, b) with radius r is

$$(x - a)^2 + (y - b)^2 = r^2.$$

Solving for y , the equations of the upper and lower halves of the circle (Figure B.9) are

$$y = b + \sqrt{r^2 - (x - a)^2} \quad \text{Upper half of the circle}$$

$$y = b - \sqrt{r^2 - (x - a)^2} \quad \text{Lower half of the circle}$$

EXAMPLE 4 Sets involving circles

- Find the equation of the circle with center $(2, 4)$ passing through $(-2, 1)$.
- Describe the set of points satisfying $x^2 + y^2 - 4x - 6y < 12$.

SOLUTION

- The radius of the circle equals the length of the line segment between the center $(2, 4)$ and the point on the circle $(-2, 1)$, which is

$$\sqrt{(2 - (-2))^2 + (4 - 1)^2} = 5.$$

Therefore, the equation of the circle is

$$(x - 2)^2 + (y - 4)^2 = 25.$$

- To put this inequality in a recognizable form, we complete the square on the left side of the inequality:

$$\begin{aligned} x^2 + y^2 - 4x - 6y &= x^2 - 4x + 4 - 4 + y^2 - 6y + 9 - 9 \\ &= \underbrace{x^2 - 4x + 4}_{(x - 2)^2} + \underbrace{y^2 - 6y + 9}_{(y - 3)^2} - 4 - 9 \\ &= (x - 2)^2 + (y - 3)^2 - 13. \end{aligned}$$

Add and subtract the square of half the coefficient of x . Add and subtract the square of half the coefficient of y .

Therefore, the original inequality becomes

$$(x - 2)^2 + (y - 3)^2 - 13 < 12, \quad \text{or} \quad (x - 2)^2 + (y - 3)^2 < 25.$$

This inequality describes those points that lie within the circle centered at $(2, 3)$ with radius 5 (Figure B.10). Note that a dashed curve is used to indicate that the circle itself is not part of the solution.

Figure B.10

Related Exercises 35–36 ◀

► Recall that the procedure shown here for completing the square works when the coefficient on the quadratic term is 1. When the coefficient is not 1, it must be factored out before completing the square.

► A **circle** is the set of all points whose distance from a fixed point is a constant. A **disk** is the set of all points within and possibly on a circle.

Figure B.11

- Given a particular line, we often talk about *the* equation of a line. But the equation of a specific line is not unique. Having found one equation, we can multiply it by any nonzero constant to produce another equation of the same line.

Equations of Lines

The **slope** m of the line passing through the points $P_1(x_1, y_1)$ and $P_2(x_2, y_2)$ is the *rise over run* (Figure B.11), computed as

$$m = \frac{\text{change in vertical coordinate}}{\text{change in horizontal coordinate}} = \frac{y_2 - y_1}{x_2 - x_1}.$$

Equations of a Line

Point-slope form The equation of the line with slope m passing through the point (x_1, y_1) is $y - y_1 = m(x - x_1)$.

Slope-intercept form The equation of the line with slope m and y-intercept $(0, b)$ is $y = mx + b$ (Figure B.12a).

General linear equation The equation $Ax + By + C = 0$ describes a line in the plane, provided A and B are not both zero.

Vertical and horizontal lines The vertical line that passes through $(a, 0)$ has an equation $x = a$; its slope is undefined. The horizontal line through $(0, b)$ has an equation $y = b$, with slope equal to 0 (Figure B.12b).

Figure B.12

EXAMPLE 5 Working with linear equations Find an equation of the line passing through the points $(1, -2)$ and $(-4, 5)$.

SOLUTION The slope of the line through the points $(1, -2)$ and $(-4, 5)$ is

$$m = \frac{5 - (-2)}{-4 - 1} = \frac{7}{-5} = -\frac{7}{5}.$$

Using the point $(1, -2)$, the point-slope form of the equation is

$$y - (-2) = -\frac{7}{5}(x - 1).$$

Solving for y yields the slope-intercept form of the equation:

$$y = -\frac{7}{5}x - \frac{3}{5}.$$

- Because both points $(1, -2)$ and $(-4, 5)$ lie on the line and must satisfy the equation of the line, either point can be used to determine an equation of the line.

Related Exercise 39 ◀

Figure B.13

Parallel and Perpendicular Lines

Two lines in the plane may have either of two special relationships to each other: They may be parallel or perpendicular.

Parallel Lines

Two distinct nonvertical lines are **parallel** if they have the same slope; that is, the lines with equations $y = mx + b$ and $y = Mx + B$ are parallel if and only if $m = M$ (Figure B.13). Two distinct vertical lines are parallel.

EXAMPLE 6 Parallel lines Find an equation of the line parallel to $3x - 6y + 12 = 0$ that intersects the x -axis at $(4, 0)$.

SOLUTION

Solving the equation $3x - 6y + 12 = 0$ for y , we have

$$y = \frac{1}{2}x + 2.$$

This line has a slope of $\frac{1}{2}$ and any line parallel to it has a slope of $\frac{1}{2}$. Therefore, the line that passes through $(4, 0)$ with slope $\frac{1}{2}$ has the point-slope equation $y - 0 = \frac{1}{2}(x - 4)$. After simplifying, an equation of the line is

$$y = \frac{1}{2}x - 2.$$

Notice that the slopes of the two lines are the same; only the y -intercepts differ.

Related Exercise 42 ◀

- The slopes of perpendicular lines are *negative reciprocals* of each other.

Figure B.14

Perpendicular Lines

Two lines with slopes $m \neq 0$ and $M \neq 0$ are **perpendicular** if and only if $mM = -1$, or equivalently, $m = -1/M$ (Figure B.14).

EXAMPLE 7 Perpendicular lines Find an equation of the line passing through the point $(-2, 5)$ perpendicular to the line ℓ : $4x - 2y + 7 = 0$.

SOLUTION

The equation of ℓ can be written $y = 2x + \frac{7}{2}$, which reveals that its slope is 2. Therefore, the slope of any line perpendicular to ℓ is $-\frac{1}{2}$. The line with slope $-\frac{1}{2}$ passing through the point $(-2, 5)$ is

$$y - 5 = -\frac{1}{2}(x + 2), \quad \text{or} \quad y = -\frac{x}{2} + 4.$$

Getting Started

- State the meaning of $\{x: -4 < x \leq 10\}$. Express the set $\{x: -4 < x \leq 10\}$ using interval notation and draw it on a number line.
- Write the interval $(-\infty, 2)$ in set notation and draw it on a number line.
- Give the definition of $|x|$.
- Write the inequality $|x - 2| \leq 3$ without absolute value symbols.
- Write the inequality $|2x - 4| \geq 3$ without absolute value symbols.
- Write an equation of the set of all points that are a distance of 5 units from the point $(2, 3)$.
- Explain how to find the distance between two points whose coordinates are known.
- Sketch the set of points $\{(x, y): x^2 + (y - 2)^2 > 16\}$.

9. Give an equation of the upper half of the circle centered at the origin with radius 6.
10. What are the possible solution sets of the equation $x^2 + y^2 + Cx + Dy + E = 0$?
11. Give an equation of the line with slope m that passes through the point $(4, -2)$.
12. Give an equation of the line with slope m and y -intercept $(0, 6)$.
13. What is the relationship between the slopes of two parallel lines?
14. What is the relationship between the slopes of two perpendicular lines?

Practice Exercises

15–20. Algebra review Simplify or evaluate the following expressions without a calculator.

15. $(1/8)^{-2/3}$
16. $\sqrt[3]{-125} + \sqrt{1/25}$
17. $(u + v)^2 - (u - v)^2$
18. $\frac{(a + h)^2 - a^2}{h}$
19. $\frac{1}{x + h} - \frac{1}{x}$
20. $\frac{2}{x + 3} - \frac{2}{x - 3}$

21–26. Algebra review

21. Factor $y^2 - y^{-2}$.
22. Solve $x^3 - 9x = 0$.
23. Solve $u^4 - 11u^2 + 18 = 0$.
24. Solve $4^x - 6(2^x) = -8$.
25. Simplify $\frac{(x + h)^3 - x^3}{h}$, for $h \neq 0$.
26. Rewrite $\frac{\sqrt{x + h} - \sqrt{x}}{h}$, where $h \neq 0$, without square roots in the numerator.

27–30. Solving inequalities Solve the following inequalities and draw the solution on a number line.

27. $x^2 - 6x + 5 < 0$
28. $\frac{x + 1}{x + 2} < 6$
29. $\frac{x^2 - 9x + 20}{x - 6} \leq 0$
30. $x\sqrt{x - 1} > 0$

31–34. Inequalities with absolute values Solve the following inequalities. Then draw the solution on a number line and express it using interval notation.

31. $|3x - 4| > 8$
32. $1 \leq |x| \leq 10$
33. $3 < |2x - 1| < 5$
34. $2 < |\frac{x}{2} - 5| < 6$

35–36. Circle calculations Solve the following problems.

35. Find the equation of the lower half of the circle with center $(-1, 2)$ and radius 3.
36. Describe the set of points that satisfy $x^2 + y^2 + 6x + 8y \geq 25$.
- 37–40. Working with linear equations** Find an equation of the line ℓ that satisfies the given condition. Then draw the graph of ℓ .
37. ℓ has slope $5/3$ and y -intercept $(0, 4)$.
38. ℓ has undefined slope and passes through $(0, 5)$.
39. ℓ has y -intercept $(0, -4)$ and x -intercept $(5, 0)$.
40. ℓ is parallel to the x -axis and passes through the point $(2, 3)$.

41–42. Parallel lines Find an equation of the following lines and draw their graphs.

41. The line with y -intercept $(0, 12)$ parallel to the line $x + 2y = 8$
42. The line with x -intercept $(-6, 0)$ parallel to the line $2x - 5 = 0$

43–44. Perpendicular lines Find an equation of the following lines.

43. The line passing through $(3, -6)$ perpendicular to the line $y = -3x + 2$
44. The perpendicular bisector of the line segment joining the points $(-9, 2)$ and $(3, -5)$

Explorations and Challenges

45. Explain why or why not State whether the following statements are true and give an explanation or counterexample.

- a. $\sqrt{16} = \pm 4$.
- b. $\sqrt{4^2} = \sqrt{(-4)^2}$.
- c. There are two real numbers that satisfy the condition $|x| = -2$.
- d. $|\pi^2 - 9| < 0$.
- e. The point $(1, 1)$ is inside the circle of radius 1 centered at the origin.
- f. $\sqrt{x^4} = x^2$ for all real numbers x .
- g. $\sqrt{a^2} < \sqrt{b^2}$ implies $a < b$ for all real numbers a and b .

46–48. Intervals to sets Express the following intervals in set notation. Use absolute value notation when possible.

46. $(-\infty, 12)$
47. $(-\infty, -2]$ or $[4, \infty)$
48. $(2, 3]$ or $[4, 5)$

49–50. Sets in the plane Graph each set in the xy -plane.

49. $\{(x, y): |x - y| = 0\}$
50. $\{(x, y): |x| = |y|\}$

Appendix

Complex Numbers

You are probably familiar with the problem of solving a polynomial equation such as $x^2 + 1 = 0$, which has no real solutions. If we solve this equation formally using algebra, we find that the solutions are $x = \pm \sqrt{-1}$. This observation leads us to define the **imaginary unit** $i = \sqrt{-1}$, which in turn leads to complex numbers. The system of complex numbers is an extension of the real number system. Some calculations are possible only when working with complex numbers (for example, finding all the roots of a polynomial) and some calculations are easier when done with complex numbers (for example, working with trigonometric functions).

Complex Arithmetic

A complex number has the form $z = x + iy$, where the real number x is the **real part** of z (denoted $\text{Re}\{z\}$) and the real number y is the **imaginary part** of z (denoted $\text{Im}\{z\}$). Complex numbers are often displayed in a rectangular coordinate system called the **complex plane**. In this coordinate system, the horizontal axis is the **real axis** and the vertical axis is the **imaginary axis** (Figure C.1). We see that complex number $z = x + iy$ corresponds to the point (x, y) , and vice versa, for all real numbers x and y .

Figure C.1

In some situations, it is useful to represent complex numbers in terms of polar coordinates. Using Figure C.1, we see that

$$x = r \cos \theta \text{ and } y = r \sin \theta, \text{ where } r = \sqrt{x^2 + y^2}.$$

Therefore, we also have

$$z = x + iy = r(\cos \theta + i \sin \theta).$$

The quantity r is called the **modulus** of z , denoted $|z|$, and the angle θ is called the **argument** of z , denoted $\arg z$. The argument satisfies $\tan \theta = \frac{y}{x}$ and is not unique; it is determined up to multiples of 2π .

Two complex numbers w and z are equal provided $\operatorname{Re}\{w\} = \operatorname{Re}\{z\}$ and $\operatorname{Im}\{w\} = \operatorname{Im}\{z\}$. As shown in the following example, the arithmetic of real numbers applies to complex numbers.

EXAMPLE 1 Operations with complex numbers Let $z = 3 - 2i$ and $w = -2 + 4i$. Simplify the following expressions.

- a. $z + 2w$ b. $|w|$ c. z^2
 d. $2iz - 4w$ e. $\arg z$ f. $\frac{z}{w}$

SOLUTION

$$\text{a. } z + 2w = \underbrace{3 - 2i}_z + 2(\underbrace{-2 + 4i}_w) = (3 - 4) + i(-2 + 8) = -1 + 6i$$

$$\text{b. } |w| = \sqrt{(-2)^2 + 4^2} = \sqrt{20} = 2\sqrt{5}$$

$$\text{c. } z^2 = (3 - 2i)^2 = (3 - 2i)(3 - 2i) = 9 - 6i - 6i + 4\underbrace{i^2}_{-1} = 5 - 12i$$

$$\text{d. } 2iz - 4w = 2i(3 - 2i) - 4(-2 + 4i) = 6i - 4\underbrace{i^2}_{-1} + 8 - 16i = 12 - 10i$$

e. Notice that z corresponds to a point in the fourth quadrant. Therefore, $\arg z$ is the angle in the fourth quadrant that satisfies $\tan \theta = -\frac{2}{3}$. We find that $\theta \approx -0.59 \pm 2k\pi$, where k is any integer (Figure C.2).

f. We generally express a complex number explicitly in the form $x + iy$, where x and y are real numbers. So the goal here is to write z/w in this form. In this example, notice how the denominator of the fraction is written in terms of real quantities.

$$\begin{aligned} \frac{z}{w} &= \frac{3 - 2i}{-2 + 4i} \\ &= \frac{3 - 2i}{-2 + 4i} \cdot \frac{-2 - 4i}{-2 - 4i} && \text{Multiply by } 1 = \frac{-2 - 4i}{-2 - 4i}. \\ &= \frac{-6 - 12i + 4i - 8}{4 + 8i - 8i + 16} && \text{Expand.} \\ &= \frac{-14 - 8i}{20} && \text{Simplify.} \\ &= -\frac{7}{10} - \frac{2}{5}i && \text{Simplify.} \end{aligned}$$

Related Exercises 1, 3, 5, 7, 9 ◀

Figure C.2

Example 1f is instructive because it features the *complex conjugate*. Given a complex number $z = x + iy$, its **complex conjugate** is the complex number $\bar{z} = x - iy$. To obtain the complex conjugate of a number, we simply negate its imaginary part. As shown in

Figure C.3, the point associated with $\bar{z}$ is found by reflecting the point associated with z across the real axis. The complex conjugate has the following useful property:

$$z\bar{z} = (x + iy)(x - iy) = x^2 - ixy + ixy + y^2 = x^2 + y^2 = |z|^2.$$

We see that the product of a complex number and its complex conjugate is the square of the modulus, or $|z| = \sqrt{z\bar{z}}$. Furthermore, $|z| = |\bar{z}|$ and $\arg z = -\arg \bar{z}$.

Figure C.3

EXAMPLE 2 More operations with complex numbers Let $z = 2 - 5i$ and evaluate the following expressions.

a. $\bar{z}$ b. $|z|$ c. $\frac{1}{z}$ d. $\left|\frac{1}{z}\right|$

SOLUTION

a. $\bar{z} = 2 + 5i$

b. $|z| = \sqrt{z\bar{z}} = \sqrt{(2 - 5i)(2 + 5i)} = \sqrt{4 + 25} = \sqrt{29}$

c. $\frac{1}{z} = \frac{1}{2 - 5i} = \frac{1}{2 - 5i} \cdot \frac{2 + 5i}{2 + 5i}$ *Multiply numerator and denominator by conjugate.*
 $= \frac{2}{29} + \frac{5}{29}i$ *Simplify.*

d. $\left|\frac{1}{z}\right| = \left|\frac{2 + 5i}{29}\right| = \frac{\sqrt{29}}{29} = \frac{1}{\sqrt{29}}$

Notice that $\left|\frac{1}{z}\right| = \frac{1}{|z|}$, which is true for any nonzero complex number.

Related Exercises 17, 19 ◀

Euler's Formula

We know how to interpret and evaluate e^x when x is a real number. The quantity e^z is of great interest when z is a complex number. We begin by investigating e^{ix} , where x is a real number, and we proceed formally by writing the Taylor series for the exponential function centered at 0. Direct substitution, simplification, and gathering of terms leads to

$$e^{ix} = 1 + ix + \frac{(ix)^2}{2!} + \frac{(ix)^3}{3!} + \frac{(ix)^4}{4!} + \frac{(ix)^5}{5!} \cdots$$
 Substitute ix into Taylor series.

$$= 1 + ix - \frac{x^2}{2!} - i\frac{x^3}{3!} + \frac{x^4}{4!} + i\frac{x^5}{5!} \cdots$$
 Simplify.

$$= 1 - \underbrace{\frac{x^2}{2!} + \frac{x^4}{4!} + \cdots}_{\cos x} + i \underbrace{\left(x - \frac{x^3}{3!} + \frac{x^5}{5!} \cdots\right)}_{\sin x}$$
 Collect real and imaginary parts.

► Powers of i :

$$i^2 = -1$$

$$i^3 = i^2 \cdot i = -i$$

$$i^4 = i^2 \cdot i^2 = 1$$

$$i^5 = i^4 \cdot i = i$$

$$\vdots$$

and the pattern repeats.

This calculation is formal (we haven't investigated the convergence of the power series), but it suggests that when x is a real number,

$$e^{ix} = \cos x + i \sin x.$$

If we assume that the property $e^{a+b} = e^a e^b$ holds for complex numbers, then for real numbers x and y , we have **Euler's formula**,

$$e^z = e^{x+iy} = e^x e^{iy} = e^x (\cos y + i \sin y).$$

Two important consequences of Euler's formula are alternative definitions of the sine and cosine. First, note that

$$e^{-ix} = \cos(-x) + i \sin(-x) = \cos x - i \sin x.$$

Now we take weighted averages of e^{ix} and e^{-ix} to prove that (Exercise 59)

$$\cos x = \frac{e^{ix} + e^{-ix}}{2} \quad \text{and} \quad \sin x = \frac{e^{ix} - e^{-ix}}{2i}.$$

EXAMPLE 3 Working with Euler's formula Evaluate the following expressions.

- a. $e^{i\pi}$ b. $e^{\ln 2 + i\pi/2}$

SOLUTION

- a. Noting that $\operatorname{Re}\{i\pi\} = 0$ and $\operatorname{Im}\{i\pi\} = \pi$, Euler's formula gives

$$e^{i\pi} = e^0 (\cos \pi + i \sin \pi) = 1(-1 + i \cdot 0) = -1.$$

- b. $e^{\ln 2 + i\pi/2} = e^{\ln 2} \left(\cos \frac{\pi}{2} + i \sin \frac{\pi}{2} \right) = 2(0 + i) = 2i$

Related Exercise 21 ◀

EXAMPLE 4 Proving trigonometric identities Equate the real and imaginary parts of both sides of the identity $e^{i(a+b)} = e^{ia} e^{ib}$ to prove the sine and cosine addition rules.

SOLUTION On the left side, we have

$$e^{i(a+b)} = \cos(a+b) + i \sin(a+b).$$

On the right side, we have

$$\begin{aligned} e^{ia} e^{ib} &= (\cos a + i \sin a)(\cos b + i \sin b) \\ &= \cos a \cos b - \sin a \sin b + i(\cos a \sin b + \sin a \cos b). \end{aligned}$$

Equating the real parts of these two expressions, we have

$$\cos(a+b) = \cos a \cos b - \sin a \sin b.$$

Equating the imaginary parts of these two expressions, we have

$$\sin(a+b) = \cos a \sin b + \sin a \cos b.$$

Related Exercise 29 ◀

Polar Form of Complex Numbers

Recall that we can write a complex number in the form

$$z = x + iy = r(\cos \theta + i \sin \theta)$$

By Euler's formula we also know that $e^{i\theta} = \cos \theta + i \sin \theta$. Therefore, complex numbers may also be written in the *polar form*

$$z = r(\cos \theta + i \sin \theta) = re^{i\theta},$$

where r is the modulus of z and θ is the argument of z . We see immediately that $\bar{z} = re^{-i\theta}$ (Exercise 60), which tells us again that z and $\bar{z}$ are symmetric about the real axis.

Because θ is determined up to multiples of 2π , the most general representation of a complex number is $z = re^{i(\theta+2k\pi)}$, where k is any integer. We show in the next example why this generality is needed.

The polar form often simplifies complex arithmetic. For example, if

$$z_1 = r_1 e^{i\theta_1} \quad \text{and} \quad z_2 = r_2 e^{i\theta_2},$$

then

$$z_1 z_2 = r_1 e^{i\theta_1} r_2 e^{i\theta_2} = r_1 r_2 e^{i(\theta_1 + \theta_2)},$$

which says that $|z_1 z_2| = r_1 r_2$ (the modulus of the product is the product of the moduli) and $\arg z_1 z_2 = \arg z_1 + \arg z_2$ (the argument of the product is the sum of the arguments). A similar calculation (Exercise 61) shows that

$$\left| \frac{z_1}{z_2} \right| = \frac{r_1}{r_2} \quad \text{and} \quad \arg \frac{z_1}{z_2} = \arg z_1 - \arg z_2.$$

EXAMPLE 5 Arithmetic in polar form Let $z = 3 - 3i$ and $w = \sqrt{2}(-1 + i)$ and evaluate the following expressions.

- a. zw b. $\frac{w}{z}$ c. z^4 d. $w^{1/2}$

SOLUTION

We first write z and w in polar form. Notice that $|z| = \sqrt{18} = 3\sqrt{2}$ and $\arg z$ satisfies $\tan \theta = -1$, where z is in the fourth quadrant; therefore, $\theta = -\frac{\pi}{4}$. So we have $z = 3\sqrt{2}e^{-i\pi/4}$. Similarly, $|w| = 2$ and $\arg w$ satisfies $\tan \theta = -1$, where w is in the second quadrant; therefore, $\theta = \frac{3\pi}{4}$ and $w = 2e^{i3\pi/4}$.

$$\text{a. } zw = 3\sqrt{2}e^{-i\pi/4} \cdot 2e^{i3\pi/4} = 6\sqrt{2}e^{i(-\pi/4+3\pi/4)} = 6\sqrt{2}e^{i\pi/2} = 6\sqrt{2}i$$

$$\text{b. } \frac{w}{z} = \frac{2e^{i3\pi/4}}{3\sqrt{2}e^{-i\pi/4}} = \frac{2}{3\sqrt{2}}e^{i(3\pi/4+\pi/4)} = \frac{\sqrt{2}}{3}e^{i\pi} = -\frac{\sqrt{2}}{3}$$

$$\text{c. } z^4 = (3\sqrt{2}e^{-i\pi/4})^4 = (3\sqrt{2})^4(e^{-i\pi/4})^4 = 324e^{-i\pi} = -324$$

d. We begin by noting that the most general representation of w is $w = 2e^{i(3\pi/4+2k\pi)}$, where k is any integer. Therefore,

$$\begin{aligned} w^{1/2} &= (2e^{i(3\pi/4+2k\pi)})^{1/2} \\ &= \sqrt{2}e^{i(3\pi/4+2k\pi)/2} \\ &= \sqrt{2}e^{i(3\pi/8+k\pi)} \\ &= \begin{cases} \sqrt{2}e^{i3\pi/8} = \sqrt{2}\left(\cos\frac{3\pi}{8} + i\sin\frac{3\pi}{8}\right) & \text{if } k = 0 \\ \sqrt{2}e^{i11\pi/8} = \sqrt{2}\left(\cos\frac{11\pi}{8} + i\sin\frac{11\pi}{8}\right) & \text{if } k = 1. \end{cases} \end{aligned}$$

We see that there are two values of $w^{1/2}$ (Figure C.4). Using other values of k does not produce any new values.

Related Exercises 39, 40, 42 ◀

Figure C.4

Example 5d is an example of **DeMoivre's Theorem**, which states that if $z = re^{i\theta}$, then the n th roots of z are

$$\begin{aligned} z^{1/n} &= r^{1/n}e^{i(\theta+2\pi k)/n} \\ &= r^{1/n}\left(\cos\left(\frac{\theta+2k\pi}{n}\right) + i\sin\left(\frac{\theta+2k\pi}{n}\right)\right), \quad \text{for } k = 0, 1, \dots, n-1. \end{aligned}$$

Practice Exercises

1–8. Complex operations Let $z = -2 + 5i$ and $w = 3 - 4i$. Compute the following quantities.

1. $z + 3w$
2. $w - 3z$
3. z^2
4. w^3
5. z/w
6. $1/w$
7. $|z|$
8. $|w|^2$

9–16. Geometry of complex numbers Plot the following numbers in the complex plane. Then find the modulus and argument of the number.

9. $z = -1 + i$
10. $z = -4i$
11. $z = -\sqrt{3} - i$
12. $z = 1 - \frac{1}{\sqrt{3}}i$
13. $z = -12$
14. $z = 3\sqrt{3} + 3i$
15. $z = 2 + i$
16. $z = 4 - i$

17–20. More complex operations Let $z = -1 + 4i$ and $w = 5 + 2i$. Evaluate the following expressions.

17. $\bar{z}$
18. $3\bar{w}$
19. $\left| \frac{z}{2w} \right|$
20. $w\bar{w}$

21–28. Euler's formula Evaluate the following expressions.

21. $e^{-i\pi}$
22. $3e^{i3\pi/4}$
23. $-4e^{-i\pi/6}$
24. $e^{-i7\pi/6}$
25. $e^{i\pi/2} + e^{-i\pi/2}$
26. $-9e^{-i\pi/3}$
27. $2e^{i5\pi/4}$
28. $i(e^{i\pi/6} - e^{-i\pi/6})$

29–30. Trigonometric identities

29. Use the method of Example 4 to prove the identities

$$\cos(a - b) = \cos a \cos b + \sin a \sin b.$$

$$\sin(a - b) = \cos a \sin b - \sin a \cos b.$$

30. Equate the real and imaginary parts of both sides of the identity $e^{i2\theta} = e^{i\theta} \cdot e^{i\theta}$ to prove that

$$\sin 2\theta = 2 \sin \theta \cos \theta \quad \text{and} \quad \cos 2\theta = \cos^2 \theta - \sin^2 \theta.$$

31–38. Polar form Express the following numbers in polar form.

31. $z = 1 - i$
32. $z = -6i$
33. $z = -\sqrt{3} + i$
34. $z = -1 + \frac{1}{\sqrt{3}}i$

$$35. z = -2 \qquad 36. z = 4\sqrt{3} + 4i$$

$$37. z = \frac{1+i}{2} \qquad 38. z = 3(1-i)$$

39–46. Arithmetic in polar form Let $z = 2 - 2i$ and $w = -\sqrt{3} + i$. Evaluate the following expression using the polar form of z and w .

39. wz
40. $\frac{z}{w}$
41. $\frac{\bar{w}}{w} \bar{z}$
42. z^4
43. w^6
44. $\frac{1}{w^3}$
45. z^{-5}
46. $\bar{z}^3$

Explorations and Challenges

47–54. Evaluating roots Evaluate the following roots, being sure to include all possible values.

47. $(-4)^{1/2}$
48. $(2i)^{1/3}$
49. $(1 - \sqrt{3}i)^{1/2}$
50. $i^{1/4}$
51. $(1 - i)^{1/2}$
52. $(2 + 2i)^{1/3}$
53. $(-16)^{1/4}$
54. $(-8i)^{1/3}$

55–58. Solving polynomial equations Find all roots of the following equations.

55. $x^2 + 25 = 0$
56. $3x^2 + 96 = 0$
57. $x^2 + 2x + 2 = 0$
58. $x^2 - 6x + 13 = 0$

59. Sine and cosine Prove that

$$\cos x = \frac{e^{ix} + e^{-ix}}{2} \quad \text{and} \quad \sin x = \frac{e^{ix} - e^{-ix}}{2i}.$$

Section 1.3 Exercises, pp. 32–34

1. $\sin \theta = \text{opp/hyp}$; $\cos \theta = \text{adj/hyp}$; $\tan \theta = \text{opp/adj}$; $\cot \theta = \text{adj/opp}$; $\sec \theta = \text{hyp/adj}$; $\csc \theta = \text{hyp/opp}$ 3. 3 s
 5. The radian measure of an angle θ is the length s of an arc on the unit circle associated with θ . 7. $\sin^2 \theta + \cos^2 \theta = 1$, $1 + \cot^2 \theta = \csc^2 \theta$, $\tan^2 \theta + 1 = \sec^2 \theta$ 9. $\theta = 3\pi/2$
 11. $\{x: x \text{ is an odd multiple of } \pi/2\}$
 13. $-1/2$ 15. 1 17. $-1/\sqrt{3}$ 19. $1/\sqrt{3}$ 21. 1 23. -1
 25. Undefined 27. $\frac{\sqrt{2 + \sqrt{3}}}{2}$ or $\frac{\sqrt{6 + \sqrt{2}}}{4}$
 29. $\pi/4 + n\pi$, $n = 0, \pm 1, \pm 2, \dots$
 31. $\pi/6, 5\pi/6, 7\pi/6, 11\pi/6$
 33. $\pi/4 + 2n\pi, 3\pi/4 + 2n\pi$, $n = 0, \pm 1, \pm 2, \dots$
 35. $0, \pi/2, \pi, 3\pi/2$
 37. $\pi/12, 5\pi/12, 3\pi/4, 13\pi/12, 17\pi/12, 7\pi/4$
 39. 0.1007; 1.4701 41. $17.3^\circ; 72.7^\circ$
 43. $\sec \theta = \frac{r}{x} = \frac{1}{x/r} = \frac{1}{\cos \theta}$
 45. Dividing both sides of $\cos^2 \theta + \sin^2 \theta = 1$ by $\cos^2 \theta$ gives $1 + \tan^2 \theta = \sec^2 \theta$. 47. Because $\cos(\pi/2 - \theta) = \sin \theta$, for all θ , $1/\cos(\pi/2 - \theta) = 1/\sin \theta$, excluding integer multiples of π , and $\sec(\pi/2 - \theta) = \csc \theta$.
 49. a. False b. False c. False d. False e. True
 51. $\sin \theta = \frac{12}{13}$; $\tan \theta = \frac{12}{5}$; $\sec \theta = \frac{13}{5}$;
 $\csc \theta = \frac{13}{12}$; $\cot \theta = \frac{5}{12}$ 53. $\sin \theta = \frac{12}{13}$; $\cos \theta = \frac{5}{13}$; $\tan \theta = \frac{12}{5}$;
 $\sec \theta = \frac{13}{5}$; $\cot \theta = \frac{5}{12}$ 55. Amp = 3; period = 6π
 57. Amp = 3.6; period = 48 61. Area of circle is πr^2 ; $\theta/(2\pi)$ represents the proportion of area swept out by a central angle θ . Therefore, the area of such a sector is $(\theta/2\pi)\pi r^2 = r^2\theta/2$.
 63. Stretch the graph of $y = \cos x$ horizontally by a factor of 3, stretch vertically by a factor of 2, and reflect across the x -axis.

65. Stretch the graph of $y = \cos x$ horizontally by a factor of $24/\pi$; then stretch it vertically by a factor of 3.6 and shift it up 2 units.

67. $y = 3 \sin(\pi t/12 - 3\pi/4) + 13$ 69. About 6 ft
71. $d(t) = 10 \cos(4\pi t/3)$ 73. h

75.

77. 1 79. 0 81. a. No; f has a horizontal asymptote if $m = n$, and it has a slant asymptote if $m = n + 1$. b. Yes;
 $f(x) = x^4 / \sqrt{x^6 + 1}$

Section 2.6 Exercises, pp. 90–93

1. a, c 3. A function is continuous on an interval if it is continuous at each point of the interval. If the interval contains endpoints, then the function must be right- or left-continuous at those points. 5. $a = 1$, item 1; $a = 2$, item 3; $a = 3$, item 2 7. $a = 1$, item 1; $a = 2$, item 2; $a = 3$, item 1 9. a. $\lim_{x \rightarrow a^-} f(x) = f(a)$ b. $\lim_{x \rightarrow a^+} f(x) = f(a)$

11. $(0, 1)$, $(1, 2)$, $(2, 3]$, $(3, 5)$; left-continuous at 3

13. $(0, 1)$, $(1, 2)$, $[2, 3)$, $(3, 5)$; right-continuous at 2

15. $[-1, 1]$, $[-1, 1]$ 17. No; $f(-5)$ is undefined.

19. No; $f(1)$ is undefined. 21. No; $\lim_{x \rightarrow 1} f(x) = 2$ but $f(1) = 3$.

23. No; $f(4)$ is undefined. 25. $(-\infty, \infty)$

27. $(-\infty, -3)$, $(-3, 3)$, $(3, \infty)$ 29. $(-\infty, -2)$, $(-2, 2)$, $(2, \infty)$

31. 1 33. $2\sqrt{6}$ 35. 16 37. $\frac{1}{81}$ 39. a. $\lim_{x \rightarrow 1} f(x)$ does not exist.

- b. Continuous from the right c. $(-\infty, 1)$, $[1, \infty)$ 41. $(-\infty, 5]$;

- left-continuous at 5 43. $(-\infty, -2\sqrt{2}]$, $[2\sqrt{2}, \infty)$; left-continuous at

- $-2\sqrt{2}$; right-continuous at $2\sqrt{2}$ 45. $(-\infty, \infty)$ 47. $(-\infty, \infty)$

49. 3 51. 1 53. 4 55. 2 57. $-\frac{1}{2}$ 59. 0

61. $(n\pi, (n+1)\pi)$, where n is an integer; $\sqrt{2}$; $-\infty$

63. $\left(\frac{n\pi}{2}, \left(\frac{n}{2} + 1\right)\frac{\pi}{2}\right)$, where n is an odd integer; ∞ ; $\sqrt{3} - 2$

65. b. $x \approx 0.835$ 67. b. $x \approx -0.285$; $x \approx 0.778$; $x \approx 4.507$

69. a. True b. True c. False d. False

71. a. $A(r)$ is continuous on $[0, 0.08]$, and 7000 is between $A(0) = 5000$ and $A(0.08) = 11,098.20$. By the Intermediate Value Theorem, there is at least one c in $(0, 0.08)$ such that $A(c) = 7000$.

- b. $c \approx 0.034$ or 3.4%

73. $[0, \pi/2]$; 0.45 75. $(-\infty, \infty)$ 77. $[0, 16)$, $(16, \infty)$

79. The vertical line segments should not appear.

81. a, b.

83. a. 2 b. 8 c. No; $\lim_{x \rightarrow 1^-} g(x) = 2$ and $\lim_{x \rightarrow 1^+} g(x) = 8$.

85. $x_1 = \frac{1}{7}$; $x_2 = \frac{1}{2}$; $x_3 = \frac{3}{5}$ 87. Yes. Imagine there is a clone of the monk who walks down the path at the same time the monk walks up the path. The monk and his clone must cross paths at some time between dawn and dusk.

89. No; f cannot be made continuous at $x = a$ by redefining $f(a)$. 91. Removable discontinuity

93. $x = 0$ removable discontinuity; $x = 1$ infinite discontinuity

95. a. Yes b. No 97. a. For example, $f(x) = 1/(x - 1)$,

- $g(x) = x + 1$ b. For continuity, g must be continuous at 0, and f must be continuous at $g(0)$.

Section 2.7 Exercises, pp. 102–106

1. 1 3. c 5. Given any $\varepsilon > 0$ there exists a $\delta > 0$ such that $|f(x) - L| < \varepsilon$ whenever $0 < |x - a| < \delta$. 7. $0 < \delta \leq 2$
 9. a. $\delta = 1$ b. $\delta = \frac{1}{2}$ 11. a. $\delta = 2$ b. $\delta = \frac{1}{2}$
 13. a. $0 < \delta \leq 1$ b. $0 < \delta \leq 0.79$ 15. a. $0 < \delta \leq 1$
 b. $0 < \delta \leq \frac{1}{2}$ c. $0 < \delta \leq \varepsilon$ 17. a. $0 < \delta \leq 1$ b. $0 < \delta \leq \frac{1}{2}$
 c. $0 < \delta \leq \frac{\varepsilon}{2}$ 19. $\delta = \varepsilon/8$ 21. $\delta = \varepsilon$ 23. $\delta = \varepsilon$
 25. $\delta = \varepsilon/3$ 27. $\delta = \sqrt{\varepsilon}$ 29. $\delta = \min\{1, \varepsilon/8\}$ 31. $\delta = \varepsilon/2$
 33. $\delta = \min\{1, 6\varepsilon\}$ 35. $\delta = \min\{1/20, \varepsilon/200\}$
 37. $\delta = \min\{1, \sqrt{\varepsilon/2}\}$ 39. $\delta = \varepsilon/|m|$ if $m \neq 0$; use any $\delta > 0$ if $m = 0$ 41. $\delta = \min\{1, 8\varepsilon/15\}$ 45. $\delta = 1/\sqrt{N}$
 47. $\delta = 1/\sqrt{N-1}$ 49. a. False b. False c. True d. True
 51. For $x > a$, $|x - a| = x - a$. 53. a. $\delta = \varepsilon/2$ b. $\delta = \varepsilon/3$
 c. Because $\lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0} f(x) = -4$, $\lim_{x \rightarrow 0} f(x) = -4$.
 55. $\delta = \varepsilon^2$ 57. a. For each $N > 0$ there exists $\delta > 0$ such that $f(x) > N$ whenever $0 < x - a < \delta$. b. For each $N < 0$ there exists $\delta > 0$ such that $f(x) < N$ whenever $0 < a - x < \delta$.
 c. For each $N > 0$ there exists $\delta > 0$ such that $f(x) > N$ whenever $0 < a - x < \delta$. 59. $\delta = 1/N$ 61. $\delta = (-10/M)^{1/4}$
 65. $N = 1/\varepsilon$ 67. $N = M - 1$

Chapter 2 Review Exercises, pp. 106–108

1. a. False b. False c. False d. True e. False f. False
 g. False h. True 3. 12 ft/s 5. $x = -1$; $\lim_{x \rightarrow -1} f(x)$ does not exist; $x = 1$; $\lim_{x \rightarrow 1} f(x) \neq f(1)$; $x = 3$; $f(3)$ is undefined.

53. $\lim_{x \rightarrow \infty} f(x) = \infty$; $\lim_{x \rightarrow -\infty} f(x) = -\infty$

55. a. ∞ ; $-\infty$ b. $y = 3x + 2$ is the slant asymptote.

57. a. $-\infty$; ∞ b. $y = -x - 2$ is the slant asymptote.

59. a. ∞ , $-\infty$ b. $y = 4x + 5$ is the slant asymptote.

61. Horizontal asymptotes at $y = 1$ and $y = -1$; vertical asymptote at $x = 1$

63. Slant asymptotes are $y = \frac{x}{2}$ and $y = -\frac{x}{2}$.

65. No; $f(5)$ does not exist. 67. Yes; $h(5) = \lim_{x \rightarrow 5} h(x) = 4$

69. $(-\infty, -\sqrt{5}]$ and $[\sqrt{5}, \infty)$; left-continuous at $-\sqrt{5}$ and right-continuous at $\sqrt{5}$ 71. $(-\infty, -5)$, $(-5, 0)$, $(0, 5)$, and $(5, \infty)$

73. $a = 3$, $b = 0$

75.

77. a. Let $f(x) = x - \cos x$; $f(0) < 0 < f(\frac{\pi}{2})$ b. $x \approx 0.739$

79. b. $P(10) < 50 < P(2)$, $P(10) < 50 < P(30)$

- c. $x = 5$, $x = 20$ d. No; $P(x) > 30$ for all $x > 0$. e. $x = y = 10$

81. $\delta = \varepsilon$ 83. $\delta = \min\left\{1, \frac{\varepsilon}{15}\right\}$ 85. $\delta = 1/\sqrt[4]{N}$

CHAPTER 3

Section 3.1 Exercises, pp. 115–118

1. Given the point $(a, f(a))$ and any point $(x, f(x))$ near $(a, f(a))$,

the slope of the secant line joining these points is $\frac{f(x) - f(a)}{x - a}$. The

limit of this quotient as x approaches a is the slope of the tangent line at the point. 3. The average rate of change over the interval $[a, x]$

is $\frac{f(x) - f(a)}{x - a}$. The value of $\lim_{x \rightarrow a} \frac{f(x) - f(a)}{x - a}$ is the slope of the

tangent line; it is also the limit of average rates of change, which is the instantaneous rate of change at $x = a$. 5. $f'(a)$ is the slope of the tangent line at $(a, f(a))$ or the instantaneous rate of change in f at a .

7. $f(2) = 7$; $f'(2) = 4$ 9. $y = 3x - 1$ 11. -5 13. 68 ft/s

15. a. 6 b. $y = 6x - 14$

c.

17. a. -1 b. $y = -x - 2$

c.

19. a. $\frac{1}{2}$ b. $y = \frac{1}{2}x + 2$

c.

21. a. 2 b. $y = 2x + 1$ 23. a. 2 b. $y = 2x - 3$
 25. a. 4 b. $y = 4x - 8$ 27. a. 3 b. $y = 3x - 2$
 29. a. $\frac{2}{25}$ b. $y = \frac{2}{25}x + \frac{7}{25}$ 31. a. $\frac{1}{4}$ b. $y = \frac{1}{4}x + \frac{7}{4}$
 33. a. 8 b. $y = 8x$ 35. a. -14 b. $y = -14x - 16$
 37. a. -4 b. $y = -4x + 3$ 39. a. $\frac{1}{3}$ b. $y = \frac{1}{3}x + \frac{5}{3}$
 41. a. $-\frac{1}{100}$ b. $y = -\frac{x}{100} + \frac{3}{20}$ 43. $-\frac{1}{4}$ 45. $\frac{1}{5}$ 47. a. True
 b. False c. True 49. $d'(4) = 128$ ft/s; the object falls with an
 instantaneous speed of 128 ft/s four seconds after being dropped.
 51. $v'(3) = -4$ m/s per second; the instantaneous rate of change in
 the car's speed is -4 m/s² at $t = 3$ s.
 53. a. $L'(1.5) \approx 4.3$ mm/week; the talon is growing at a
 rate of approximately 4.3 mm/week at $t = 1.5$ weeks
 (answers will vary). b. $L'(a) \approx 0$, for $a \geq 4$; the talon stops
 growing at $t = 4$ weeks. 55. $D'(60) \approx 0.05$ hr/day; the number of
 daylight hours is increasing at about 0.05 hr/day, 60 days after Jan 1.
 $D'(170) \approx 0$ hr/day; the number of daylight hours is neither increas-
 ing nor decreasing 170 days after Jan 1. 57. $f(x) = 5x^2$; $a = 2$; 20
 59. $f(x) = x^4$; $a = 2$; 32 61. $f(x) = |x|$; $a = -1$; -1

b.

h	Approximation	Error
0.1	0.25002	2.0×10^{-5}
0.01	0.25000	2.0×10^{-7}
0.001	0.25000	2.0×10^{-9}

- c. Values of x on both sides of 4 are used in the formula.
 d. The centered difference approximations are more accurate than the
 forward and backward difference approximations. 65. a. 0.39470,
 0.41545 b. 0.02, 0.0003

Section 3.2 Exercises, pp. 126–130

1. f' is the slope function of f . 3. $\frac{dy}{dx}$ is the limit of $\frac{\Delta y}{\Delta x}$ as $\Delta x \rightarrow 0$.

5. 7. Yes

9. A line with a y-intercept of 1 and a slope of 3

11. $f'(x) = 7$ 13. $\frac{dy}{dx} = 2x$; $\frac{dy}{dx}\bigg|_{x=3} = 6$; $\frac{dy}{dx}\bigg|_{x=-2} = -4$

15. a-C; b-C; c-A; d-B

- 17.

19. a. Not continuous at $x = 1$ b. Not differentiable at $x = 0, 1$

21. a. $f'(x) = 5$ b. $f'(1) = 5$; $f'(2) = 5$

23. a. $f'(x) = 8x$ b. $f'(2) = 16$; $f'(4) = 32$

25. a. $f'(x) = -\frac{1}{(x+1)^2}$ b. $f'\left(-\frac{1}{2}\right) = -4$; $f'(5) = -\frac{1}{36}$

27. a. $f'(t) = -\frac{1}{2t^{3/2}}$ b. $f'(9) = -\frac{1}{54}$; $f'\left(\frac{1}{4}\right) = -4$

29. a. $f'(s) = 12s^2 + 3$ b. $f'(-3) = 111$; $f'(-1) = 15$

31. a. $v(t) = -32t + 100$ b. $v(1) = 68$ ft/s; $v(2) = 36$ ft/s

33. $\frac{dy}{dx} = \frac{1}{(x+2)^2}$; $\frac{dy}{dx}\bigg|_{x=2} = \frac{1}{16}$ 35. a. $6x + 2$

- b. $y = 8x - 13$ 37. a. $\frac{3}{2\sqrt{3x+1}}$ b. $y = 3x/10 + 13/5$

39. a. $\frac{6}{(3x+1)^2}$ b. $y = -3x/2 - 5/2$

41. a. Approx. 10 kW; approx. -5 kW

- b. $t = 6, 18$ c. $t = 12$ 43. a. $2ax + b$ b. $8x - 3$ c. 5

45. a. C, D b. A, B, E c. A, B, E, D, C 47. a-D; b-C; c-B; d-A

- 49.

53. a. $x = 1$ b. $x = 1, x = 2$ c.

55. a. $t = 0$ b. Positive c. Decreasing

57. a. True b. True c. False 59. $a = 4$

61. Yes

63. $y = -\frac{x}{3} - \frac{2}{3}$ 65. $y = \frac{x}{2} + \frac{3}{2}$ 67. (1, 2), (5, 26)

69. (1, 1), $(-\frac{1}{2}, -2)$ 71. b. $f'_+(2) = 1$; $f'_-(2) = -1$

c. f is continuous but not differentiable at $x = 2$.

Vertical tangent line $x = 2$

Vertical tangent line $x = -1$

Vertical tangent line $x = 4$

Vertical tangent line $x = 0$

75. $f'(x) = \frac{1}{3}x^{-2/3}$ and $\lim_{x \rightarrow 0^-} |f'(x)| = \lim_{x \rightarrow 0^+} |f'(x)| = \infty$

77. a.

b. 1 c. 1 d.

e. f is not differentiable at 0 because it is not continuous at 0.

Section 3.3 Exercises, pp. 135–138

1. Using the definition can be tedious. 3. The slope at every point on the graph of the function is zero. 5. Take the product of the constant and the derivative of the function. 7. 4 9. $-\frac{1}{2}$ 11. -2 13. 7.5

49. $\sin x(1 + \sec^2 x)$ 51. $2 \sin^2 x$

55. a. b. $v(t) = 30 \cos t$

d. $v(t) = 0$, for $t = (2k + 1)\frac{\pi}{2}$, where k is any nonnegative

integer; the position is $y\left((2k + 1)\frac{\pi}{2}\right) = 0$ if k is even or

$y\left((2k + 1)\frac{\pi}{2}\right) = -60$ if k is odd. e. $v(t)$ has a maximum

at $t = 2k\pi$, where k is a nonnegative integer; the position is

$y(2k\pi) = -30$. f. $a(t) = -30 \sin t$

57. $2 \cos x - x \sin x$ 59. $\frac{2 \sin x - 2x \cos x - x^2 \sin x}{x^3}$

61. $2 \csc^2 x \cot x$ 63. $2(\sec^2 x \tan x + \csc^2 x \cot x)$

65. a. False b. False c. True d. True 67. 2 69. $-\frac{1}{2}$ 71. $\frac{4}{3}$

73. a. $y = \sqrt{3}x + 2 - \frac{\pi\sqrt{3}}{6}$ b. $y = -2\sqrt{3}x + \frac{2\sqrt{3}\pi}{3} + 1$

77. $x = 7\pi/6 + 2k\pi$ and $x = 11\pi/6 + 2k\pi$, where k is an integer

85. $a = 0$ 87. a. $2 \sin x \cos x$ b. $3 \sin^2 x \cos x$ c. $4 \sin^3 x \cos x$

d. $n \sin^{n-1} x \cos x$; the conjecture is true for $n = 1$. If it holds

for $n = k$, then when $n = k + 1$, we have $\frac{d}{dx}(\sin^{k+1} x) =$

$$\frac{d}{dx}(\sin^k x \cdot \sin x) = \sin^k x \cos x + \sin x \cdot k \sin^{k-1} x \cos x = (k+1) \sin^k x \cos x.$$

89. Because D is a difference quotient for f (and $h = 0.01$ is small), D is a good approximation to f' . Therefore, the graph of D is nearly indistinguishable from the graph of $f'(x) = \cos x$.

Section 3.6 Exercises, pp. 163–168

1. The average rate of change is $\frac{f(x + \Delta x) - f(x)}{\Delta x}$, whereas the instantaneous rate of change is the limit as Δx goes to zero in this quotient. 3. Small 5. At 15 weeks, the puppy grows at a rate of 1.75 lb/week. 7. If the position of the object at time t is $s(t)$, then the acceleration at time t is $a(t) = d^2s/dt^2$. 9. $v'(T) = 0.6$; the speed of sound increases approximately 0.6 m/s for each increase of 1°C . 11. a. 40 mi/hr b. 40 mi/hr; yes c. -60 mi/hr; -60 mi/hr; south d. The patrol car drives away from the station going north until about 10:08, when it turns around and heads south, toward the station. It continues south until it passes the station at about 11:02 and keeps going south until about 11:40, when it turns around and heads north. 13. The first 200 stoves cost, on average, \$70 to produce. When 200 stoves have already been produced, the 201st stove costs \$65 to produce.

15. a.

b. $v(t) = 2t - 4$; stationary at $t = 2$, to the right on $(2, 5]$, to the left on $[0, 2)$

c. $v(1) = -2$ ft/s; $a(1) = 2$ ft/s² d. $a(2) = 2$ ft/s² e. $(2, 5]$

17. a.

b. $v(t) = 4t - 9$; stationary at $t = \frac{9}{4}$, to the right on $(\frac{9}{4}, 3]$, to the left on $[0, \frac{9}{4})$

c. $v(1) = -5$ ft/s; $a(1) = 4$ ft/s²

d. $a(\frac{9}{4}) = 4$ ft/s² e. $(\frac{9}{4}, 3]$

19. a.

b. $v(t) = 6t^2 - 42t + 60$; stationary at $t = 2$ and $t = 5$, to the right on $[0, 2)$ and $(5, 6]$, to the left on $(2, 5)$

c. $v(1) = 24$ ft/s; $a(1) = -30$ ft/s² d. $a(2) = -18$ ft/s²;

$a(5) = 18$ ft/s² e. $(2, \frac{7}{2})$, $(5, 6]$ 21. -64 ft/s; 64 ft/s

23. a. $v(t) = -32t + 32$ b. At $t = 1$ s c. 64 ft d. At $t = 3$ s

e. -64 ft/s f. $(1, 3)$ 25. a. $v(t) = -32t + 64$ b. At $t = 2$ s

c. 96 ft d. At $2 + \sqrt{6}$ s e. $-32\sqrt{6}$ ft/s f. $(2, 2 + \sqrt{6})$

27. Approx. 90.5 ft/s 29. a. $\bar{C}(x) = \frac{1000}{x} + 0.1$; $C'(x) = 0.1$

b. $\bar{C}(2000) = \$0.60/\text{item}$; $C'(2000) = \$0.10/\text{item}$

c. The average cost per item when 2000 items are produced is \$0.60/item. The cost of producing the 2001st item is \$0.10.

31. a. $\bar{C}(x) = -0.01x + 40 + 100/x$; $C'(x) = -0.02x + 40$

b. $\bar{C}(1000) = \$30.10/\text{item}$; $C'(1000) = \$20/\text{item}$

c. The average cost per item is about \$30.10 when 1000 items are produced. The cost of producing the 1001st item is \$20. 33. a. 20

b. \$20 c. $E(p) = \frac{p}{p-20}$ d. Elastic for $p > 10$; inelastic for $0 < p < 10$ e. 2.5% f. 2.5%

35. a. False b. True c. False

d. True 37. 240 ft 39. 64 ft/s 41. a. $t = 1, 2, 3$ b. It is moving in the positive direction for t in $(0, 1)$ and $(2, 3)$; it is moving in the negative direction for t in $(1, 2)$ and $t > 3$.

c. d. $(0, \frac{1}{2})$, $(1, \frac{3}{2})$, $(2, \frac{5}{2})$, $(3, \infty)$

43. a. $P(x) = 0.02x^2 + 50x - 100$

b. $\frac{P(x)}{x} = 0.02x + 50 - \frac{100}{x}$; $\frac{dP}{dx} = 0.04x + 50$

c. $\frac{P(500)}{500} = 59.8$; $\frac{dP}{dx}(500) = 70$

d. The profit, on average, for each of the first 500 items produced is 59.8; the profit for the 501st item produced is 70.

45. a. $P(x) = 0.04x^2 + 100x - 800$

b. $\frac{P(x)}{x} = 0.04x + 100 - \frac{800}{x}$; $\frac{dP}{dx} = 0.08x + 100$

c. $\frac{P(1000)}{1000} = 139.2$; $P'(1000) = 180$

d. The average profit per item for each of the first 1000 items produced is \$139.20. The profit for the 1001st item produced is \$180.

47. About 1935; approx. 890,000 people/yr (answers will vary)

49. a.  b. $v = \frac{100}{(t+1)^2}$

The marble moves fastest at the beginning and slows considerably over the first 5 s. It continues to slow but never actually stops.

d. $t = 4$ s e. $t = -1 + \sqrt{2} \approx 0.414$ s

51. a. $C'(x) = -\frac{125,000,000}{x^2} + 1.5$;

$\bar{C}(x) = \frac{C(x)}{25,000} = 50 + \frac{5000}{x} + 0.00006x$

b. $C'(5000) = -3.5$; $\bar{C}(5000) = 51.3$ c. Marginal cost: If the batch size is increased from 5000 to 5001, then the cost of producing 25,000 gadgets will *decrease* by about \$3.50. Average cost: When batch size is 5000, it costs \$51.30 *per item* to produce all 25,000 gadgets.

53. a. $R(p) = \frac{100p}{p^2 + 1}$

b. $R'(p) = \frac{100(1 - p^2)}{(p^2 + 1)^2}$

c. $p = 1$

55. a.

b. $dx/dt = 10 \cos t + 10 \sin t$

c. $t = 3\pi/4 + k\pi$, where k is any positive integer

d. The graph implies that the spring never stops oscillating.

In reality, the weight would eventually come to rest.

57. a. Juan starts faster than Jean and opens up a big lead. Then Juan slows down while Jean speeds up. Jean catches up, and the race finishes in a tie. b. Same average velocity c. Tie d. At $t = 2$, $\theta'(2) = \pi/2$ rad/min; $\theta'(4) = \pi$ = Jean's greatest velocity

e. At $t = 2$, $\varphi'(2) = \pi/2$ rad/min; $\varphi'(0) = \pi$ = Juan's greatest velocity

59. a. $-T'(1) = -80$, $-T'(3) = 80$

b. $-T'(x) < 0$ for $0 \leq x < 2$; $-T'(x) > 0$ for $2 < x \leq 4$ c. Near $x = 0$, with $x > 0$, $-T'(x) < 0$, so heat flows toward the end of the rod. Similarly, near $x = 4$, with $x < 4$, $-T'(x) > 0$.

Section 3.7 Exercises, pp. 173–176

1. $\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx}$; $\frac{d}{dx}(f(g(x))) = f'(g(x)) \cdot g'(x)$

3. $u = x^3 + x + 1$; $y = u^4$; $4(x^3 + x + 1)^3(3x^2 + 1)$

5. $u = \cos x$, $y = u^3$, $dy/dx = -3 \cos^2 x \sin x$;

$u = x^3$, $y = \cos u$, $dy/dx = -3x^2 \sin x^3$ 7. $g(x)$, x 9. $\frac{2}{\sqrt{4x+1}}$

11. 50 13. $u = 3x + 7$; $f(u) = u^{10}$; $30(3x + 7)^9$

15. $u = \sin x$; $f(u) = u^5$; $5 \sin^4 x \cos x$

17. $u = x^2 + 1$; $f(u) = \sqrt{u}$; $\frac{x}{\sqrt{x^2 + 1}}$

19. $u = 2 + \sin x$; $f(u) = \sqrt{u}$; $\frac{\cos x}{2\sqrt{2 + \sin x}}$

21. $u = 5x^2$; $f(u) = \tan u$; $10x \sec^2 5x^2$ 23. a. 100 b. -100

c. -16 d. 40 e. 40 25. $10(6x + 7)(3x^2 + 7x)^9$

27. $\frac{5}{\sqrt{10x+1}}$ 29. $-\frac{315x^2}{(7x^3+1)^4}$ 31. $3 \sec(3x+1) \tan(3x+1)$

33. $\frac{\sec^2 \sqrt{w}}{2\sqrt{w}}$ 35. $(12x^2 + 3) \cos(4x^3 + 3x + 1)$

37. $\frac{10}{3(5x+1)^{1/3}}$ 39. $-\frac{3}{2^{7/4}x^{3/4}(4x-3)^{5/4}}$

41. $5 \sec x (\sec x + \tan x)^5$ 43. $25(12x^5 - 9x^2)(2x^6 - 3x^3 + 3)^{24}$

45. $9(1 + 2 \tan u)^{3.5} \sec^2 u$ 47. $-\frac{\cot x \csc^2 x}{\sqrt{1 + \cot^2 x}}$

49. $8(\sin^2 x + 1)^3 \sin x \cos x$

51. $-15 \sin^4(\cos 3x)(\sin 3x)(\cos(\cos 3x))$

53. $\frac{1}{2\sqrt{x + \sqrt{x}}}\left(1 + \frac{1}{2\sqrt{x}}\right)$

55. $f'(g(x^2))g'(x^2)2x$ 57. $\frac{5x^4}{(x+1)^6}$

59. $(x^2 + 1)^2(7x^2 + 1)$ 61. $\theta(2 + 5\theta \tan 5\theta) \sec 5\theta$

63. $4((x+2)(x^2+1))^3(3x+1)(x+1)$ 65. $\frac{4x^3 - 2 \sin 2x}{5(x^4 + \cos 2x)^{4/5}}$

67. $2(p+3)(\sin p^2 + p(p+3)\cos p^2)$

69. $f'(x)/(2\sqrt{f(x)})$ 71. a. True b. True c. True

d. False 73. -0.297 hPa/min 75. $2 \cos x^2 - 4x^2 \sin x^2$

77. $\frac{4(5x^2 - 1)}{(x^2 + 1)^4}$ 79. $y = 6x - 1$

81. a. $h(4) = 9, h'(4) = -6$ b. $y = -6x + 33$

83. a. $y = 4\sqrt{3}(x - \pi/6) + 2$

85. a. -3π b. -5π 87. a. $\frac{d^2 y}{dt^2} = -\frac{y_0 k}{m} \cos\left(t\sqrt{\frac{k}{m}}\right)$

89. a. 10.88 hr b. $D'(t) = \frac{6\pi}{365} \sin\left(\frac{2\pi(t+10)}{365}\right)$

c. 2.87 min/day; on March 1, the length of day is increasing at a rate of about 2.87 min/day.

d. e. Most rapidly: approximately March 22 and September 22; least rapidly: approximately December 21 and June 21

91. a. $E'(t) = 400 + 200 \cos \frac{\pi t}{12}$ MW

b. At noon; $E'(0) = 600$ MW c. At midnight; $E'(12) = 200$ MW

95. a. $g(x) = (x^2 - 3)^5$; $a = 2$ b. 20

97. a. $g(x) = \sin x^2$; $a = \pi/2$ b. $\pi \cos(\pi^2/4)$ 99. $10 f'(25)$

Section 3.8 Exercises, pp. 181–184

1. There may be more than one expression for y or y' .

3. When derived implicitly, dy/dx is usually given in terms

of both x and y . 5. $\frac{1}{2y}$ 7. $\frac{1}{\cos y}$ 9. a. $(0, 0)$, $(0, -1)$, $(0, 1)$

c. Slope at $(0, 0)$ is 2; slope at $(0, -1)$ and $(1, 0)$ is -1 .

11. $\frac{d^2 y}{dx^2} = -\frac{2}{9y^5}$ 13. a. $-\frac{x^3}{y^3}$ b. 1 15. a. $\frac{2}{y}$ b. 1

17. a. $\frac{20x^3}{\cos y}$ b. -20 19. a. $-\frac{1}{\sin y}$ b. -1 21. a. $-\frac{y}{x}$ b. -7

23. a. $-\frac{1}{4x^{2/3}y^{1/3}}$ b. $-\frac{1}{4}$ 25. a. $-\frac{3y}{x + 3y^{2/3}}$ b. $-\frac{24}{13}$

27. $\frac{\cos x}{1 - \cos y}$ 29. $-\frac{1}{1 + \sin y}$ 31. $\frac{1 - y \cos xy}{x \cos xy - 1}$ 33. $\frac{1}{2y(\sin y^2 + 1)}$

35. $\frac{3x^2(x-y)^2 + 2y}{2x}$ 37. $\frac{13y - 18x^2}{21y^2 - 13x}$ 39. $\frac{5\sqrt{x^4 + y^2} - 2x^3}{y - 6y^2\sqrt{x^4 + y^2}}$

41. a. $\frac{dK}{dL} = -\frac{K}{2L}$ b. -4 43. $\frac{dr}{dh} = \frac{h - 2r}{h}$; -3

45. b. $y = -5x$ 47. b. $y = -5x/4 + 7/2$ 49. b. $y = \frac{x}{2}$

51. $-\frac{1}{4y^3}$ 53. $\frac{\sin y}{(\cos y - 1)^3}$ 55. $-\frac{\cos y}{(1 + \sin y)^3}$ 57. a. False

b. True c. False d. False 59. a. $\frac{y(3\sqrt{x} + 2y^{3/2})}{x(\sqrt{x} - 2y^{3/2})}$ b. -5

61. a. $y = x - 1$ and $y = -x + 2$

b.

63. a. $y' = -\frac{2xy}{x^2 + 4}$ b. $y = \frac{1}{2}x + 2$, $y = -\frac{1}{2}x + 2$

c. $-\frac{16x}{(x^2 + 4)^2}$ 65. a. $\left(\frac{5}{4}, \frac{1}{2}\right)$ b. No

67. Horizontal: $y = -6$, $y = 0$; vertical: $x = 1$, $x = 3$

69. a. $\frac{dy}{dx} = 0$ on the $y = 1$ branch; $\frac{dy}{dx} = \frac{1}{2y + 1}$ on the other two

branches. b. $f_1(x) = 1$, $f_2(x) = \frac{-1 + \sqrt{4x - 3}}{2}$,

$f_3(x) = \frac{-1 - \sqrt{4x - 3}}{2}$ c.

71. a. $\frac{dy}{dx} = \frac{x-x^3}{y}$ b. $f_1(x) = \sqrt{x^2 - \frac{x^4}{2}}$; $f_2(x) = -\sqrt{x^2 - \frac{x^4}{2}}$
 c. 73. $y = \frac{x}{5}$

75. $y = \frac{4x}{5} - \frac{3}{5}$

77. $y = -2x + \frac{5\pi}{4}$

79. a. Tangent line $y = -\frac{9x}{11} + \frac{20}{11}$; normal line $y = \frac{11x}{9} - \frac{2}{9}$

b. 81. a. Tangent line $y = -\frac{x}{3} + \frac{8}{3}$; normal line $y = 3x - 4$

83. For $y = mx$, $dy/dx = m$; for $x^2 + y^2 = a^2$, $dy/dx = -x/y$.

85. For $xy = a$, $dy/dx = -y/x$; for $x^2 - y^2 = b$, $dy/dx = x/y$. Because $(-y/x) \cdot (x/y) = -1$, the families of curves

form orthogonal trajectories. 87. $\frac{7y^2 - 3x^2 - 4xy^2 - 4x^3}{2y(2x^2 + 2y^2 - 7x)}$

89. $\frac{2y^2(5 + 8x\sqrt{y})}{(1 + 2x\sqrt{y})^3}$ 91. No horizontal tangent line; vertical tangent lines at $(2, 1)$, $(-2, 1)$

Section 3.9 Exercises, pp. 188–193

1. As the side length s of a cube changes, the surface area $6s^2$ changes as well. 3. The other two opposite sides decrease in length.

5. a. $V = 200h$; $\frac{dV}{dt} = 200 \frac{dh}{dt}$ b. $50 \text{ ft}^3/\text{min}$ c. $\frac{1}{20} \text{ ft}/\text{min}$

7. a. $\frac{dV}{dt} = 4\pi r^2 \frac{dr}{dt}$ b. $128\pi \text{ in}^3/\text{min}$ c. $\frac{1}{10\pi} \text{ in}/\text{min}$

9. 59 11. a. $40 \text{ m}^2/\text{s}$ b. $80 \text{ m}^2/\text{s}$

13. a. $4 \text{ m}^2/\text{s}$ b. $\sqrt{2} \text{ m}^2/\text{s}$ c. $2\sqrt{2} \text{ m}/\text{s}$ 15. a. $\frac{1}{4\pi} \text{ cm}/\text{s}$ b. $\frac{1}{2} \text{ cm}/\text{s}$ 17. $-40\pi \text{ ft}^2/\text{min}$ 19. $\frac{3}{80\pi} \text{ in}/\text{min}$

23. $720.3 \text{ mi}/\text{hr}$ 25. $\frac{3\sqrt{5}}{2} \text{ ft}/\text{s}$ 27. $57.9 \text{ ft}/\text{s}$ 29. $4.66 \text{ in}/\text{s}$

31. $\frac{\pi}{2} \text{ ft}^3/\text{min}$ 33. $-75\pi \text{ cm}^3/\text{s}$ 35. $2592\pi \text{ cm}^3/\text{s}$

37. $9\pi \text{ ft}^3/\text{min}$ 39. $\frac{1}{25\pi} \text{ m}/\text{min}$ 41. $\frac{5}{24} \text{ ft}/\text{s}$

43. $-\frac{8}{3} \text{ ft}/\text{s}$, $-\frac{32}{3} \text{ ft}/\text{s}$ 45. $\frac{d\theta}{dt} = \frac{1}{5} \text{ rad}/\text{s}$, $\frac{d\theta}{dt} = \frac{1}{8} \text{ rad}/\text{s}$

47. $-0.0201 \text{ rad}/\text{s}$ 49. $10 \tan 20^\circ \text{ km}/\text{hr} \approx 3.6 \text{ km}/\text{hr}$

51. a. $187.5 \text{ ft}/\text{s}$ b. $0.938 \text{ rad}/\text{s}$ 53. a. $P = \frac{1}{2} v^2 \frac{dm}{dt}$

c. $17,388.7 \text{ W}$ d. 4347.2 W 55. $11.06 \text{ m}/\text{hr}$

57. $\frac{1}{500} \text{ m}/\text{min}$; 2000 min 59. $0.54 \text{ rad}/\text{hr}$

61. $\frac{d\theta}{dt} = 0 \text{ rad}/\text{s}$, for all $t \geq 0$ 63. a. $-\frac{\sqrt{3}}{10} \text{ m}/\text{hr}$ b. $-1 \text{ m}^2/\text{hr}$

Chapter 3 Review Exercises, pp. 193–197

1. a. False b. False c. False d. False e. True

3. $-\frac{2x}{(x^2 + 5)^2}$ 9. $2x^2 + 2\pi x + 7$ 11. $\frac{\cos w - \sin w}{2\sqrt{2} + \sin w + \cos w}$

13. $5(\tan w + 10)^4 \sec^2 w$ 15. $6x^3\sqrt{1+x^4}$

17. $5t^2 \cos t + 10t \sin t$ 19. $\frac{v^{99}(99v + 100)}{(v + 1)^2}$ 21. $\frac{2 \sec 2w \tan 2w}{(\sec 2w + 1)^2}$

23. $100t \sin^9(5t^2 + 1) \cos(5t^2 + 1)$ 25. $1000t(5t^2 + 10)^{99}$

27. $(8\theta + 12) \sec^2(\theta^2 + 3\theta + 2)$

29. $\frac{32u^2 + 8u + 1}{(8u + 1)^2}$ 31. $(\sec^2 \sin \theta) \cos \theta$

33. $-\frac{\cos \sqrt{\cos^2 x + 1} \cos x \sin x}{\sqrt{\cos^2 x + 1}}$ 35. $x^2 \sin x$

37. $x(x + 1)^{2/5}$ 39. $\frac{1}{(x + 1)^2} \cos\left(\frac{x}{x + 1}\right)$

41. $\sec w \tan w$ 43. $1 + \csc(x - y)$ 45. $-\frac{xy}{x^2 + 2y^2}$

47. $\sqrt{2} + \frac{\pi\sqrt{2}}{4}$ 49. $\frac{3x + 11}{4(x + 2)^{3/2}}$

51. $\frac{2(xy + y^2)}{(x + 2y)^3} = \frac{2}{(x + 2y)^3}$ 53. $y = x$ 55. $y = -\frac{4x}{5} + \frac{24}{5}$

57. $x^2 f'(x) + 2xf(x)$ 59. $\frac{g(x)(xf'(x) + f(x)) - xf(x)g'(x)}{g^2(x)}$

61. a-D; b-C; c-B; d-A

63.

65. a. 27 b. $\frac{16}{27}$ c. 72 d. 1215 67. a. $\frac{36}{25}$ b. $\frac{1}{2\sqrt{3}}$ c. 0

69. $y = 24x - 118$ 71. a. 84 ft/s b. 7 s c. 384 ft
 d. 96 ft/s 73. a. 2.70 million people/yr
 b. The slope of the secant line through the two points is approximately equal to the slope of that tangent line at $t = 55$.
 c. 2.217 million people/yr 75. $x = 4$; $x = 6$
 77. $f(x) = \tan(\pi\sqrt{3x-11})$, $a = 5$; $f'(5) = 3\pi/4$
 79. a. $\bar{C}(3000) = \$341.67$; $C'(3000) = \$280$ b. The average cost of producing the first 3000 lawn mowers is \$341.67 per mower. The cost of producing the 3001st lawn mower is \$280.
 81. a. 6550 people/yr b. $p'(40) = 4800$ people/yr
 83. 50 mi/hr 85. $-5 \sin 65^\circ$ ft/s ≈ -4.5 ft/s
 87. -0.166 rad/s 89. 1.5 ft/s

CHAPTER 4

Section 4.1 Exercises, pp. 204–207

1. f has an absolute maximum at c in $[a, b]$ if $f(x) \leq f(c)$ for all x in $[a, b]$. f has an absolute minimum at c in $[a, b]$ if $f(x) \geq f(c)$ for all x in $[a, b]$. 3. The function must be continuous on a closed interval.

9. Evaluate the function at the critical points and at the endpoints of the interval. 11. Abs. min at $x = c_2$; abs. max at $x = b$ 13. Abs. min at $x = a$; no abs. max 15. Local min at $x = q$; s; local max at $x = p$; r; abs. min at $x = a$; abs. max at $x = b$ 17. Local max at $x = p$; r; local min at $x = q$; abs. max at $x = p$; abs. min at $x = b$

23. $x = \frac{2}{3}$ 25. $x = \pm 3$ 27. $x = -\frac{2}{3}, \frac{1}{3}$ 29. $x = \pm \frac{2a}{\sqrt{3}}$

31. $t = \frac{1}{2}$ 33. $x = 1$ 35. $x = -4, 0$

37. If $a \geq 0$, there is no critical point. If $a < 0$, $x = 2a/3$ is the only critical point. 39. $t = \pm a$ 41. Abs. max: -1 at $x = 3$; abs. min: -10 at $x = 0$ 43. Abs. max: 0 at $x = 0, 3$; abs. min: -4 at $x = -1, 2$ 45. Abs. max: 234 at $x = 3$; abs. min: -38 at $x = -1$ 47. Abs. max: 1 at $x = 0, \pi$; abs. min: 0 at $x = \pi/2$ 49. Abs. max: 1 at $x = \pi/6$; abs. min: -1 at $x = -\pi/6$

51. Abs. max: $\frac{\pi}{3} + \frac{\sqrt{3}}{2}$ at $x = \frac{\pi}{3}$; abs. min: 0 at $x = 0$

53. Abs. max: 11 at $x = 1$; abs. min: -16 at $x = 4$

55. Abs. max: 27 at $x = -3$; abs. min: $-\frac{19}{12}$ at $x = \frac{1}{2}$

57. Abs. max: $\frac{1}{100,000}$ at $x = 1$; abs. min: $-\frac{1}{100,000}$ at $x = -1$

59. Abs. max: $\sqrt{2}$ at $x = \pm \pi/4$; abs. min: 1 at $x = 0$

61. Abs. max: 3 at $x = \pm 1$; abs. min: 0 at $x = -2, 0, 2$

63. a. The velocity of the downstream wind v_2 is less than or equal to the velocity of the upstream wind, so $0 \leq v_2 \leq v_1$, or $0 \leq \frac{v_2}{v_1} \leq 1$.

- b. $R(1) = 0$ c. $R(0) = \frac{1}{2}$ d. 0.593 is the maximum fraction of power that can be extracted from a wind stream by a wind turbine.

65. $t = 2$ s 67. $t = 2$ s 69. a. 50 b. 45 71. a. False

- b. False c. False d. True 73. a. $x = 0, 1, 2$

- b. Abs. max: 8 at $x = -2$; abs. min: 0 at $x = 0, 2$

75. a. $x \approx -5.18, -2.03, 1.11, 4.25$

- b. $x \approx -5.18$ and $x \approx 1.11$ correspond to local max;

- $x \approx -2.03$ and $x \approx 4.25$ correspond to local min.

- c. Abs. max: 2.24 ; abs. min: -2.24 77. a. $x = 5 - 4\sqrt{2}$

- b. $x = 5 - 4\sqrt{2}$ corresponds to a local max. c. No abs. max or min

79. Abs. max: 4 at $x = -1$; abs. min: -8 at $x = 3$

81. a. $T(x) = \frac{\sqrt{2500 + x^2}}{2} + \frac{50 - x}{4}$ b. $x = 50/\sqrt{3}$

- c. $T(50/\sqrt{3}) \approx 34.15$, $T(0) = 37.50$, $T(50) \approx 35.36$

83. a. 1, 3, 0, 1 b. Because $h'(2) \neq 0$, h does not have a local extreme value at $x = 2$. However, g may have a local extremum at $x = 2$ (because $g'(2) = 0$). 85. a. $f(x) - f(c) \leq 0$ for all x near c

- b. $\lim_{x \rightarrow c^+} \frac{f(x) - f(c)}{x - c} \leq 0$ c. $\lim_{x \rightarrow c^-} \frac{f(x) - f(c)}{x - c} \geq 0$

- d. Because $f'(c)$ exists, $\lim_{x \rightarrow c^+} \frac{f(x) - f(c)}{x - c} = \lim_{x \rightarrow c^-} \frac{f(x) - f(c)}{x - c} = f'(c)$. By parts (b) and (c), we must have that $f'(c) = 0$.

Section 4.2 Exercises, pp. 211–214

1. If f is a continuous function on the closed interval $[a, b]$ and is differentiable on (a, b) , and the slope of the secant line that joins $(a, f(a))$ to $(b, f(b))$ is zero, then there is at least one value c in (a, b) at which the slope of the line tangent to f at $(c, f(c))$ is also zero.

3. $f(x) = |x|$ is not differentiable at 0 . 5. b. $c = 1$

7. b. $c = \pm 2/\sqrt[4]{5} \approx \pm 1.34$

9. 11. $x = \frac{1}{3}$

13. $x = \pi/4$ 15. Does not apply 17. $x = \frac{5}{3}$ 19. Average lapse rate $= -6.3^\circ/\text{km}$. You cannot conclude that the lapse rate at a point exceeds the threshold value. 21. a. Yes b. $c = \frac{1}{2}$ 23. a. Does not apply 25. a. Yes b. $c = \frac{9}{4}$ 27. a. Yes b. $c \approx \pm 0.881$ 29. a. Yes b. $c = (\frac{7}{4})^{3/4} \approx 1.52$ 31. a. Does not apply 33. a. False b. True c. False 35. h and p 37.

39. No such point exists; function is not continuous at 2. 41. The car's average velocity is $(30 - 0)/(28/60) = 64.3$ mi/hr. By the MVT, the car's instantaneous velocity was 64.3 mi/hr at some time. 43. Average speed $= 11.625$ mi/hr. By the MVT, the speed was exactly 11.625 mi/hr at least once. By the Intermediate Value Theorem, all speeds between 0 and 11.625 mi/hr were reached. Because the initial and final speeds were 0 mi/hr, the speed of 11 mi/hr was reached at least twice. 45. $\frac{f(b) - f(a)}{b - a} = A(a + b) + B$ and $f'(x) = 2Ax + B$; $2Ax + B = A(a + b) + B$ implies that $x = \frac{a + b}{2}$, the midpoint of $[a, b]$. 47. $\tan^2 x$ and $\sec^2 x$ differ by a constant; in fact, $\tan^2 x - \sec^2 x = -1$. 49. Bolt's average speed was 37.58 km/hr, so he exceeded 37 km/hr during the race. 51. Hint: By the MVT, there is a value of c in $(2, 4)$ for which $\frac{f(4) - f(2)}{4 - 2} = f'(c)$. 55. b. $c = \frac{1}{2}$

Section 4.3 Exercises, pp. 224–227

1. f is increasing on I if $f'(x) > 0$ for all x in I ; f is decreasing on I if $f'(x) < 0$ for all x in I . 3. a. $x = 3$ b. Increasing on $(3, \infty)$; decreasing on $(-\infty, 3)$

5.

7.

9.

11.

13. a. Concave up on $(-\infty, 2)$; concave down on $(2, \infty)$ b. Inflection point at $x = 2$ 15. Yes; consider the graph of $y = \sqrt{x}$ on $(0, \infty)$. 17. $f(x) = x^4$ 19. Increasing on $(-\infty, 0)$; decreasing on $(0, \infty)$ 21. Decreasing on $(-\infty, 1)$; increasing on $(1, \infty)$ 23. Increasing on $(-\infty, 1)$ and $(4, \infty)$; decreasing on $(1, 4)$ 25. Increasing on $(-\infty, 1/2)$; decreasing on $(1/2, \infty)$ 27. Increasing on $(-\infty, 0)$, $(1, 2)$; decreasing on $(0, 1)$, $(2, \infty)$ 29. Increasing on $(\frac{\pi}{6}, \frac{5\pi}{6})$; decreasing on $(0, \frac{\pi}{6})$, $(\frac{5\pi}{6}, 2\pi)$ 31. Increasing on $(-\pi, -2\pi/3)$, $(-\pi/3, 0)$, $(\pi/3, 2\pi/3)$; decreasing on $(-2\pi/3, -\pi/3)$, $(0, \pi/3)$, $(2\pi/3, \pi)$ 33. Increasing on $(-1, 0)$, $(1, \infty)$; decreasing on $(-\infty, -1)$, $(0, 1)$ 35. Increasing on $(1, 4)$; decreasing on $(-\infty, 1)$, $(4, \infty)$ 37. Increasing on $(-\infty, -\frac{1}{2})$, $(0, \frac{1}{2})$; decreasing on $(-\frac{1}{2}, 0)$, $(\frac{1}{2}, \infty)$ 39. Increasing on $(0, \pi)$; decreasing on $(\pi, 2\pi)$ 41. a. $x = 0$ b. Local min at $x = 0$ c. Abs. min: 3 at $x = 0$; abs. max: 12 at $x = -3$ 43. a. $x = \pm\sqrt{2}$ b. Local min at $x = -\sqrt{2}$; local max at $x = \sqrt{2}$ c. Abs. max: 2 at $x = \sqrt{2}$; abs. min: -2 at $x = -\sqrt{2}$ 45. a. $x = \pm\sqrt{3}$ b. Local min at $x = -\sqrt{3}$; local max at $x = \sqrt{3}$ c. Abs. max: 28 at $x = -4$; abs. min: $-6\sqrt{3}$ at $x = -\sqrt{3}$ 47. a. $x = 2$ and $x = 0$ b. Local max at $x = 0$; local min at $x = 2$ c. Abs. min: $-10\sqrt[3]{25}$ at $x = -5$; abs. max: 0 at $x = 0, 5$ 49. Abs. max: $-\frac{14}{3}$ at $x = \frac{1}{3}$ 51. Abs. min: $36\sqrt[3]{\pi/6}$ at $r = \sqrt[3]{6/\pi}$ 53.

55.

57. Concave up on $(-\infty, 0)$, $(1, \infty)$; concave down on $(0, 1)$; inflection points at $x = 0$ and $x = 1$ 59. Concave up on $(-\infty, 0)$, $(2, \infty)$; concave down on $(0, 2)$; inflection points at $x = 0$ and $x = 2$ 61. Concave up on $(-\infty, -3)$; concave down on $(-3, \infty)$; no inflection point 63. Concave down on $(0, \pi)$; concave up on $(\pi, 2\pi)$; inflection point at $\theta = \pi$ 65. Concave down on $(-1, 0)$; concave up on $(0, \infty)$; inflection point at $x = 0$ 67. Concave up on $(0, 2)$, $(4, \infty)$; concave down on $(-\infty, 0)$, $(2, 4)$; inflection points at $x = 0, 2, 4$ 69. Critical pts. $x = 0$ and $x = 2$; local max at $x = 0$, local min at $x = 2$ 71. Critical pt. $x = 0$; local max at $x = 0$ 73. Critical pts. $x = 0$ and $x = 1$; local max at $x = 0$; local min at $x = 1$ 75. Critical pts. $x = 0$ and $x = 1$; local min at $x = 1$; inconclusive at $x = 0$ 77. Critical pts. $x = 0$ and $x \approx 0.327$; local max at $x = 0$; local min at $x \approx 0.327$ 79. Critical pts. $t = -3$ and $t = 2$; local max at $t = -3$; local min at $t = 2$ 81. Critical pt. $x = -a$; inconclusive at $x = -a$ 83. Critical pts. $x = \pi/9$, $x = 5\pi/9$, and $x = 7\pi/9$; local max at $x = \pi/9$ and $x = 7\pi/9$; local min at $x = 5\pi/9$ 85. a. True b. False c. True d. False e. False 87. a-C-i, b-B-iii, c-A-ii

91.

93.

95.

97. a. Increasing on $(-2, 2)$; decreasing on $(-3, -2)$ b. Critical pts. $x = -2$ and $x = 0$; local min at $x = -2$; neither a local max nor min at $x = 0$ c. Inflection pts. at $x = -1$ and $x = 0$ d. Concave up on $(-3, -1)$, $(0, 2)$; concave down on $(-1, 0)$

e.

f.

99. a. $E = \frac{p}{p-50}$ b. -1.4% c. $E'(p) = -\frac{ab}{(a-bp)^2} < 0$, for $p \geq 0, p \neq a/b$ d. $E(p) = -b$, for $p \geq 0$ 101. a. 300 b. $t = \sqrt{10}$ c. $t = \sqrt{b/3}$ **Section 4.4 Exercises, pp. 234–236**

1. We need to know on which interval(s) to graph f . 3. No; the domain of any polynomial is $(-\infty, \infty)$; there is no vertical asymptote. Also, $\lim_{x \rightarrow \pm\infty} p(x) = \pm\infty$, where p is any polynomial; there is no horizontal asymptote. 5. Evaluate the function at the critical points and at the endpoints. Then find the largest and smallest values among those candidates.

7.

9.

11.

13.

15.

17.

19.

21.

23.

25.

47. Critical pts. at $x = 1, 3$; local max at $x = 1$; local min at $x = 3$; inflection pt. at $x = 2$; increasing on $(0, 1)$, $(3, 4)$; decreasing on $(1, 3)$; concave up on $(2, 4)$; concave down on $(0, 2)$

55. a. False b. False
c. False d. True

b. Water is being added at all times. c. No concavity. d. h' has an abs. max at all points of $[0, 10]$.

c. Concave down. d. h' has abs. max at $t = 0$.

c. Concave up. d. h' has abs. max at $t = 10$.

c. Concave down on $(0, 5)$, then concave up on $(5, 10)$; inflection pt. at $t = 5$. d. h' has abs. max at $t = 0$ and $t = 10$.

c. First, no concavity; then concave down, no concavity, concave up, and, finally, no concavity. d. h' has abs. max at all points of an interval $[0, a]$ and $[b, 10]$.

c. Concave down on $(0, 5)$; concave up on $(5, 10)$; inflection pt. at $t = 5$. d. h' has abs. max at $t = 0$ and $t = 10$.

Section 4.5 Exercises, pp. 241–247

1. Objective function, constraint(s) 3. $Q = x^2(10 - x)$; $Q = (10 - y)^2 y$ 5. a. $P(x) = 100x - 10x^2$ b. Abs. max: 250 at $x = 5$ 7. $\frac{23}{2}$ and $\frac{23}{2}$ 9. $5\sqrt{2}$ and $5\sqrt{2}$ 11. Width = length = $\frac{5}{2}$ 13. Width = length = 10 15. $x = \sqrt{6}$, $y = 2\sqrt{6}$ 17. $\frac{10}{\sqrt{2}}$ by $\frac{5}{\sqrt{2}}$ 19. Length = width = height = 2

21. $\frac{4}{\sqrt[3]{5}}$ ft by $\frac{4}{\sqrt[3]{5}}$ ft by $5^{2/3}$ ft 23. Approx. (0.59, 0.65)
25. (5, 15), distance ≈ 47.4 27. a. A point $8/\sqrt{5}$ mi from the point on the shore nearest the woman in the direction of the restaurant
b. $9/\sqrt{13}$ mi/hr 29. A point $7\sqrt{3}/6$ mi from the point on shore nearest the island, in the direction of the power station
31. 18.2 ft 33. $h = \frac{20}{\sqrt{3}}$; $r = 20\sqrt{\frac{2}{3}}$
35. a. $r = \sqrt[3]{177/\pi} \approx 3.83$ cm; $h = 2\sqrt[3]{177/\pi} \approx 7.67$ cm
b. $r = \sqrt[3]{177/2\pi} \approx 3.04$ cm; $h = 2\sqrt[3]{708/\pi} \approx 12.17$ cm; part (b) is closer to the real can. 37. $\sqrt{15}$ m by $2\sqrt{15}$ m
39. 12" by 6" by 3"; 216 in³ 41. Lower rectangular pane is approximately 5.6 ft wide by 2.8 ft high. 43. $r/h = \sqrt{2}$
45. $r = \sqrt{2R/\sqrt{3}}$; $h = 2R/\sqrt{3}$ 47. 3:1 49. a. 0, 30, 25
b. 42.5 mi/hr c. The units of $p/g(v)$ are \$/mi and so are the units of w/v . Therefore, $L\left(\frac{p}{g(v)} + \frac{w}{v}\right)$ gives the total cost of a trip of L miles. d. Approx. 62.9 mi/hr e. Neither; the zeros of $C'(v)$ are independent of L . f. Decreased slightly, to 62.5 mi/hr
g. Decreased to 60.8 mi/hr 51. $\sqrt{30} \approx 5.5$ ft 53. The point $12/(\sqrt[3]{2} + 1) \approx 5.3$ m from the weaker source 55. b. Because the speed of light is constant, travel time is minimized when distance is minimized. 57. $r = h = \sqrt[3]{450/\pi}$ m 59. a. $\frac{a_1 + a_2}{2}$
b. $\frac{a_1 + a_2 + a_3}{3}$ c. $\frac{a_1 + a_2 + \cdots + a_n}{n}$ 61. $\frac{\pi}{3}$
63. When the seat is at its lowest point 65. a. $P = 2/\sqrt{3}$ units from the midpoint of the base 67. You can run 12 mi/hr if you run toward the point $3/16$ mi ahead of the locomotive (when it passes the point nearest you). 69. a. $r = 2R/3$; $h = \frac{1}{3}H$ b. $r = R/2$; $h = H/2$
71. $(1 + \sqrt{3})$ mi ≈ 2.7 mi 73. (i) $(p - \frac{1}{2}, \sqrt{p - \frac{1}{2}})$
(ii) (0, 0) 75. Let the angle of the cuts be φ_1 and φ_2 , where $\varphi_1 + \varphi_2 = \theta$. The volume of the notch is proportional to $\tan \varphi_1 + \tan \varphi_2 = \tan \varphi_1 + \tan(\theta - \varphi_1)$, which is minimized when $\varphi_1 = \varphi_2 = \frac{\theta}{2}$. 77. $x \approx 38.81$, $y \approx 55.03$

CHAPTER 7

Section 7.1 Exercises, pp. 439–442

1. If a function f is not one-to-one, then there are domain values, x_1 and x_2 , such that $x_1 \neq x_2$ but $f(x_1) = f(x_2)$. If f^{-1} exists, by definition, $f^{-1}(f(x_1)) = x_1$ and $f^{-1}(f(x_2)) = x_2$ so that f^{-1} assigns two different range values to the single domain value of $f(x_1)$.

5. $(-\infty, -1]$, $[-1, 1]$, $[1, \infty)$ 7. $f^{-1}(x) = \frac{1}{2}x$

11. $g_1(x) = x^2 + 1$; $D = [0, \infty)$; $R = [1, \infty)$; $g_1^{-1}(x) = \sqrt{x-1}$;
 $D = [1, \infty)$; $R = [0, \infty)$ 13. 1; 5; 7 15. $1/4$ 17. $(-\infty, \infty)$

19. $(-\infty, 5) \cup (5, \infty)$ 21. $(-\infty, 0)$, $(0, \infty)$

23. $f^{-1}(x) = -\frac{1}{4}x + 2$

25. $f^{-1}(x) = x^2 - 2$

27. $f^{-1}(x) = 2 + \sqrt{x+1}$

29. a. $f^{-1}(x) = -\frac{1}{4}x + \frac{3}{2}$ 31. a. $f^{-1}(x) = x^{3/5} + 7$

33. a. $f^{-1}(x) = \frac{1}{1-x}$ 35. $f^{-1}(x) = \sqrt{6/x+9}$, $x > 0$

37. a. $f_1(x) = \sqrt{1-x^2}$; $0 \leq x \leq 1$

$f_2(x) = \sqrt{1-x^2}$; $-1 \leq x \leq 0$

$f_3(x) = -\sqrt{1-x^2}$; $-1 \leq x \leq 0$

$f_4(x) = -\sqrt{1-x^2}$; $0 \leq x \leq 1$

b. $f_1^{-1}(x) = \sqrt{1-x^2}$; $0 \leq x \leq 1$

$f_2^{-1}(x) = -\sqrt{1-x^2}$; $0 \leq x \leq 1$

$f_3^{-1}(x) = -\sqrt{1-x^2}$; $-1 \leq x \leq 0$

$f_4^{-1}(x) = \sqrt{1-x^2}$; $-1 \leq x \leq 0$

39. $\frac{1}{3}$ 41. $-\frac{1}{5}$ 43. $\frac{1}{2}$ 45. 4 47. $\frac{1}{12}$ 49. $\frac{1}{4}$ 51. $\frac{5}{4}$

53. a. $\frac{1}{2}$ b. $\frac{2}{3}$ c. Cannot be determined d. $\frac{3}{2}$

55. a. False b. True c. False d. True e. True

57. $f^{-1}(x) = \sqrt[3]{x-1}$, $D = \mathbb{R}$

59. $f_1^{-1}(x) = \sqrt{2/x-2}$, $D_1 = (0, 1]$; $f_2^{-1}(x) = -\sqrt{2/x-2}$,

$D_2 = (0, 1]$ 61. $f^{-1}(x) = \frac{x+4}{3}$; $(f^{-1})'(x) = \frac{1}{3}$

63. $f^{-1}(x) = \sqrt{x+4}$, $x \geq -4$;

$(f^{-1})'(x) = 1/(2\sqrt{x+4})$, $x > -4$

65. $f^{-1}(x) = x^2 - 2$, $x \geq 0$; $(f^{-1})'(x) = 2x$, $x \geq 0$

67. $f^{-1}(x) = \frac{1}{x^2}$, $x > 0$; $(f^{-1})'(x) = -\frac{2}{x^3}$, $x > 0$

69. $r = \sqrt[3]{\frac{3V}{4\pi}}$ 71. $r = \sqrt{\frac{V}{10\pi}}$

73. a.

f is one-to-one on the intervals $(-\infty, -1/\sqrt{2}]$, $[-1/\sqrt{2}, 0]$, $[0, 1/\sqrt{2}]$, $[1/\sqrt{2}, \infty)$

b. $x = \frac{\sqrt{1 \pm \sqrt{4y+1}}}{2}$, $-\frac{\sqrt{1 \pm \sqrt{4y+1}}}{2}$

75. $f^{-1}(x) = \frac{3\left(\sqrt[3]{\frac{x}{2}} + \frac{\sqrt{3}\sqrt{32+27x^2}}{18}\right)^2 - 2}{3\sqrt[3]{\frac{x}{2}} + \frac{\sqrt{3}\sqrt{32+27x^2}}{18}}$;

one-to-one on $(-\infty, \infty)$

77. a. $a = f'(x_0)$; $b = y_0 - x_0 f'(x_0)$
 b. $c = \frac{1}{f'(x_0)}$; $d = x_0 - \frac{y_0}{f'(x_0)}$
 c. $L(x) = f'(x_0)x + y_0 - x_0 f'(x_0)$, so
 $L^{-1}(x) = \frac{x - y_0 + x_0 f'(x_0)}{f'(x_0)} = M(x)$.

Section 7.2 Exercises, pp. 453–456

1. $D = (0, \infty)$, $R = (-\infty, \infty)$
 3. $x = e^y \Rightarrow 1 = e^y y'(x) \Rightarrow y'(x) = 1/e^y = 1/x$
 5. $\frac{d}{dx}(\ln kx) = \frac{d}{dx}(\ln k + \ln x) = \frac{d}{dx}(\ln x)$ 7. $f^{-1}(x) = \frac{1}{2} \ln x - 3$

CHAPTER 9

Section 9.1 Exercises, pp. 604–606

1. a. 1 b. Linear 3. Yes 5. $\frac{\pi}{2} < t < \frac{3\pi}{2}$

21. $y = 3t - \frac{e^{-2t}}{2} + C$ 23. $y = 2 \ln |\sec 2x| - 3 \sin x + C$

25. $y = 2t^6 + 6t^{-1} - 2t^2 + C_1 t + C_2$

27. $u = \frac{x^{11}}{2} + \frac{x^9}{2} - \frac{x^7}{2} + \frac{5}{x} + C_1 x + C_2$

29. $u = \ln(x^2 + 4) - \tan^{-1} \frac{x}{2} + C$ 31. $y = \sin^{-1} x + C_1 x + C_2$

33. $y = e^t + t + 3$ 35. $y = x^3 + x^{-3} - 2, x > 0$

37. $y = -t^5 + 2t^3 + 1$ 39. $y = e^t(t-2) + 2(t+1)$

41. $u = \frac{1}{4} \tan^{-1} \frac{x}{4} - 4x + 2$ 43. a. $v(t) = -9.8t + 29.4$;

$s(t) = -4.9t^2 + 29.4t + 30$; the object is above the ground for approximately $0 \leq t \leq 6.89$. b. The highest point of 74.1 m is reached at $t = 3$ s. 45. The amount of resource is increasing for $H < 75$ and is constant if $H = 75$. If $H = 100$, the resource vanishes at approximately 28 time units.

47. $h = (\sqrt{1.96} - 0.1t\sqrt{2g})^2 \approx (1.4 - 0.44t)^2, 0 \leq t \leq 3.16$; the tank is empty after approximately 3.16 s.

49. a. False b. False c. True 51. c. $y = C_1 \sin kt + C_2 \cos kt$

53. b. $C = \frac{K-50}{50}$

d. 300

55. c. The decay rate is greater for the $n = 1$ model.

Section 9.2 Exercises, pp. 611–614

1. At selected points (t_0, y_0) in the region of interest draw a short line segment with slope $f(t_0, y_0)$. 3. $y(3.1) \approx 1.6$

5. a. D b. B c. A d. C

7.

9. An initial condition of $y(0) = -1$ leads to a constant solution. For any other initial condition, the solutions are increasing over time.

13.

11. An initial condition of $y(0) = 1$ leads to a constant solution. Initial conditions $y(0) = A$ lead to solutions that are increasing over time if $A > 1$.

15.

17. a. $y = 1, y = -1$

b. Solutions are increasing for $|y| > 1$ and decreasing for $|y| < 1$. c. Initial conditions $y(0) = A$ lead to increasing solutions if $|A| > 1$ and decreasing solutions if $|A| < 1$.

21. The equilibrium solutions are $P = 0$ and $P = 500$.

25. $y(0.5) \approx u_1 = 4; y(1) \approx u_2 = 8$

27. $y(0.1) \approx u_1 = 1.1; y(0.2) \approx u_2 = 1.19$

19. a. $y = \pi/2, y = -\pi/2$

b. Solutions are increasing for $|y| < \pi/2$ and decreasing for $|y| > \pi/2$. c. Initial conditions $y(0) = A$ lead to increasing solutions if $|A| < \pi/2$ and decreasing solutions if $\pi/2 < |A| < \pi$.

23. The equilibrium solutions are $P = 0$ and $P = 3200$.

c. Time step $\Delta t = 0.025$; smaller time steps generally produce more accurate results. d. Halving the time steps results in approximately halving the error.

33. a. $y(2) \approx 0.00604662$ b. 0.012269

c. $y(2) \approx 0.0115292$ d. Error in part (c) is approximately half of the error in part (b).

35. a. $y(4) \approx 3.05765$ b. 0.0339321

c. $y(4) \approx 3.0739$ d. Error in part (c) is approximately half of the error in part (b).

37. a. True b. False

39. a. $y = 3$ b, c.

41. a. $y = 0$ and $y = 3$

b, c.

43. a. $y = -2, y = 0$, and $y = 3$

b, c.

45. a. $\Delta t = \frac{b-a}{N}$ b. $u_1 = A + f(a, A) \frac{b-a}{N}$

c. $u_{k+1} = u_k + f(t_k, u_k) \frac{b-a}{N}$, where $u_0 = A$ and

$t_k = a + k(b-a)/N$, for $k = 0, 1, 2, \dots, N-1$

47. a.

b. Increasing for $A < 98$ and decreasing for $A > 98$

c. $v(t) = 98$

Section 9.3 Exercises, pp. 618–620

1. A first-order separable differential equation has the form $g(y) y'(t) = h(t)$, where the factor $g(y)$ is a function of y and

$h(t)$ is a function of t . 3. No 5. $y = \frac{t^4}{4} + C$

7. $y = \pm \sqrt{2t^3 + C}$ 9. $y = -2 \ln\left(\frac{1}{2} \cos t + C\right)$

11. $y = \frac{x}{1 + Cx}$ 13. $y = \pm \frac{1}{\sqrt{C - \cos t}}$ 15. $u = \ln\left(\frac{e^{2x}}{2} + C\right)$

17. $y = \sqrt{t^3 + 81}$ 19. Not separable 21. $y(t) = -e^{e^t - 1}$

23. $y = \ln(e^x + 2)$ 25. $y = \ln\left(\frac{\ln^4 t}{4} + 1\right)$

27. $y = \sqrt{\tan t}, 0 < t < \pi/2$ 29. $y = \sqrt{t^2 + 3}$ 31. $y = \ln t + 2$

33. $y^3 - 3y = 2t^3$,
 $-1 < t < 1$

35. $\cos u = 2 - 2 \sin \frac{x}{2}$, $\frac{\pi}{3} < x < \frac{5\pi}{3}$

41. a. True b. False c. True

43. a. $y = -2 \ln \left(\frac{x^2}{4} + \cos x^2 + C \right)$ b. $C = 0, 1, 1 - \frac{\pi}{8}$

45. $y = kx$ 47. b. $\sqrt{gm/k}$

c. $v = \sqrt{\frac{g}{a}} \frac{Ce^{2\sqrt{ag}t} - 1}{Ce^{2\sqrt{ag}t} + 1}$, $t \geq 0$, where $a = \frac{k}{m}$

49. a. $h = \left(\sqrt{H} - \frac{kt}{2} \right)^2$, $0 \leq t \leq \frac{2\sqrt{H}}{k}$

b. $h = (\sqrt{0.5} - 0.05t)^2$, $0 \leq t \leq 14.1$

c. Approx. 14.1 s

51. a.

R is positive if $0 < M < 4$; R has a maximum value when $M = \frac{4}{e}$; $\lim_{M \rightarrow 0} R(M) = 0$.

b. $M(t) = 4^{1-e^{-t}}$, $t \geq 0$; the tumor grows quickly at first and then the rate of growth slows down; the limiting size of the tumor is 4.

53. a. $y = \frac{1}{1-t}$, $t < 1$ b. $y = \frac{1}{\sqrt{2}\sqrt{1-t}}$, $t < 1$

c. $y = \frac{1}{(n(1-t))^{1/n}}$, $t < 1$; as $t \rightarrow 1^-$, $y \rightarrow \infty$

Section 9.4 Exercises, pp. 625–627

1. $y = 17e^{-10t} - 13$ 3. $y = Ce^{-4t} + \frac{3}{2}$ 5. $y = Ce^{3t} + \frac{4}{3}$

7. $y = Ce^{-2x} - 2$ 9. $u = Ce^{-12t} + \frac{5}{4}$ 11. $y = 7e^{3t} + 2$

39. $y = 1 + \frac{t}{2} + \frac{5}{2t}, t > 0$ 41. $y = \frac{1}{2}e^{3t} + \frac{7}{2}e^t$

45. $y(t) = \frac{6}{t}, t > 0$ 47. $y = \frac{9t^5 + 20t^3 + 15t + 76}{15(t^2 + 1)}$

Section 9.5 Exercises, pp. 634–636

1. The growth rate function specifies the rate of growth of the population. The population is increasing when the growth rate function is positive, and the population is decreasing when the growth rate function is negative. 3. If the growth rate function is positive (it does not matter whether it is increasing or decreasing), then the population is increasing. 5. It is a linear, first-order differential equation. 7. The solution curves in the FH -plane are closed curves that circulate around the equilibrium point.

15. $P' = 0.2P\left(1 - \frac{P}{300}\right);$

$$P = \frac{300}{5e^{-0.2t} + 1}, t \geq 0$$

17. $P = \frac{2000}{9e^{-\ln(27/7)t} + 1}, t \geq 0$ 19. $M = K\left(\frac{M_0}{K}\right)e^{-rt}, t \geq 0$

21. $M = 1200 \cdot 0.075^{\exp(-0.05t)}, t \geq 0$

23. a. $m'(t) = -0.008t + 80, m(0) = 0$

b. $m = 10,000 - 10,000e^{-0.008t}, t \geq 0$

25. a. $m'(t) = -0.005t + 100, m(0) = 80,000$

b. $m = 60,000e^{-0.005t} + 20,000, t \geq 0$

27. a. x is the predator population; y is the prey population.b. $x' = 0$ on the lines $x = 0$ and $y = \frac{1}{2}$; $y' = 0$ on the lines $y = 0$ and $x = \frac{1}{4}$. c. $(0, 0), (\frac{1}{4}, \frac{1}{2})$ d. $x' > 0$ and $y' > 0$ for $0 < x < \frac{1}{4}, y > \frac{1}{2}$ $x' > 0$ and $y' < 0$ for $x > \frac{1}{4}, y > \frac{1}{2}$ $x' < 0$ and $y' < 0$ for $x > \frac{1}{4}, 0 < y < \frac{1}{2}$ $x' < 0$ and $y' > 0$ for $0 < x < \frac{1}{4}, 0 < y < \frac{1}{2}$

e. The solution evolves in the clockwise direction.

29. a. x is the predator population; y is the prey population.b. $x' = 0$ on the lines $x = 0$ and $y = 3$; $y' = 0$ on the lines $y = 0$ and $x = 2$. c. $(0, 0), (2, 3)$ d. $x' > 0$ and $y' > 0$ for $0 < x < 2, y > 3$ $x' > 0$ and $y' < 0$ for $x > 2, y > 3$ $x' < 0$ and $y' < 0$ for $x > 2, 0 < y < 3$ $x' < 0$ and $y' > 0$ for $0 < x < 2, 0 < y < 3$

e. The solution evolves in the clockwise direction.

31. a. True b. True c. True 35. c. $\lim_{t \rightarrow \infty} m(t) = C_i V$, which is the amount of substance in the tank when the tank is filled with the inflow solution. d. Increasing R increases the rate at which the solution in the tank reaches the steady-state concentration.

37. a. $I = \frac{V}{R} e^{-t/(RC)}$ b. $Q = VC(1 - e^{-t/(RC)})$

39. a. $y'(x) = \frac{y(c - dx)}{x(-a + by)}$

Chapter 9 Review Exercises, pp. 636–638

1. a. False b. False c. True d. True e. False
 3. $y = Ce^{-2t} + 3$ 5. $y = Ce^{t^2}$ 7. $y = Ce^{\tan^{-1}t}$
 9. $y = \tan(t^2 + t + C)$ 11. $y = \sin t + t^2 + 1$
 13. $Q = 8(1 - e^{t-1})$ 15. $u = (3 + t^{2/3})^{3/2}$, $t > 0$

17. $s = \frac{t\sqrt{2}}{\sqrt{t^2 + 1}}$

19. a, b.

- c. $0 < A < 2$
 d. $A > 2$ or $A < 0$
 e. $y = 0$ and $y = 2$

21. a. 1.05, 1.09762 b. 1.04939, 1.09651 c. 0.00217, 0.00106; the error in part (b) is smaller. 23. $y = -3$ (unstable), $y = 0$ (stable), $y = 5$ (unstable) 25. $y = -1$ (unstable), $y = 0$ (stable), $y = 2$ (unstable) 27. a. 0.0713 b. $P = \frac{1600}{79e^{-0.0713t} + 1}$, $t \geq 0$

c. Approx. 61 hours 29. a. $m = 2000(1 - e^{-0.005t})$
 b. 2000 g c. Approx. 599 minutes 31. a. x represents the predator. b. $x'(t) = 0$ when $x = 0$ and $y = 2$. $y'(t) = 0$ when $y = 0$ and $x = 5$. c. $(0, 0)$ and $(5, 2)$ d. $x' > 0$, $y' > 0$ when $0 < x < 5$ and $y > 2$; $x' > 0$, $y' < 0$ when $x > 5$ and $y > 2$; $x' < 0$, $y' < 0$ when $x > 5$ and $0 < y < 2$; $x' < 0$, $y' > 0$ when $0 < x < 5$ and $0 < y < 2$
 e. Clockwise direction

33. a. $p_1 = 3$, $p_2 = -4$ b. $y(t) = t^3 - t^4$, $t > 0$

CHAPTER 10

Section 10.1 Exercises, pp. 647–649

1. A sequence is an ordered list of numbers. Example: $1, \frac{1}{3}, \frac{1}{9}, \frac{1}{27}, \dots$

3. 1, 1, 2, 6, 24 5. $a_n = (-1)^{n+1}n$, for $n = 1, 2, 3, \dots$;
 $a_n = (-1)^n(n + 1)$, for $n = 0, 1, 2, \dots$ (Answers may vary.)

7. e 9. 1, 5, 14, 30 11. $\sum_{k=1}^{\infty} 10$ (Answer is not unique.)

13. $\frac{1}{10}, \frac{1}{100}, \frac{1}{1000}, \frac{1}{10,000}$ 15. $-\frac{1}{2}, \frac{1}{4}, -\frac{1}{8}, \frac{1}{16}$ 17. $\frac{4}{3}, \frac{8}{5}, \frac{16}{9}, \frac{32}{17}$

19. 2, 1, 0, 1 21. 2, 4, 8, 16 23. 10, 18, 42, 114 25. $1, \frac{1}{2}, \frac{2}{3}, \frac{3}{5}$

27. a. $\frac{1}{32}, \frac{1}{64}$ b. $a_1 = 1$, $a_{n+1} = \frac{1}{2}a_n$, for $n \geq 1$ c. $a_n = \frac{1}{2^{n-1}}$, for $n \geq 1$

29. a. 32, 64 b. $a_1 = 1$, $a_{n+1} = 2a_n$, for $n \geq 1$
 c. $a_n = 2^{n-1}$, for $n \geq 1$ 31. a. 243, 729 b. $a_1 = 1$, $a_{n+1} = 3a_n$, for $n \geq 1$ c. $a_n = 3^{n-1}$, for $n \geq 1$ 33. a. $-5, 5$ b. $a_1 = -5$, $a_{n+1} = -a_n$, for $n \geq 1$ c. $a_n = (-1)^n \cdot 5$, for $n \geq 1$

35. 9, 99, 999, 9999; diverges 37. $\frac{1}{10}, \frac{1}{100}, \frac{1}{1000}, \frac{1}{10,000}$;

converges to 0 39. 2, 4, 2, 4; diverges 41. 2, 2, 2, 2; converges to 2

43. 54.545, 54.959, 54.996, 55.000; converges to 55

45.

CHAPTER 11

Section 11.1 Exercises, pp. 718–721

1. $f(0) = p_2(0), f'(0) = p_2'(0),$ and $f''(0) = p_2''(0)$
 3. 1, 1.05, 1.04875 5. $p_3(x) = 1 + x^2 + x^3; 1.048$
 7. $p_3(x) = 1 + (x - 2) + 2(x - 2)^2; 0.898$
 9. a. $p_1(x) = 8 + 12(x - 1)$
 b. $p_2(x) = 8 + 12(x - 1) + 3(x - 1)^2$ c. 9.2; 9.23

11. a. $p_1(x) = 1 - 2x$ b. $p_2(x) = 1 - 2x + 2x^2$ c. 0.8, 0.82
 13. a. $p_1(x) = 1 - x$ b. $p_2(x) = 1 - x + x^2$ c. 0.95, 0.9525
 15. a. $p_1(x) = 2 + \frac{1}{12}(x - 8)$
 b. $p_2(x) = 2 + \frac{1}{12}(x - 8) - \frac{1}{288}(x - 8)^2$ c. 1.9583, 1.95747
 17. $p_1(x) = 1, p_2(x) = p_3(x) = 1 - 18x^2, p_4(x) = 1 - 18x^2 + 54x^4$
 19. $p_3(x) = 1 - 3x + 6x^2 - 10x^3$,
 $p_4(x) = 1 - 3x + 6x^2 - 10x^3 + 15x^4$
 21. $p_1(x) = 1 + 3(x - 1), p_2(x) = 1 + 3(x - 1) + 3(x - 1)^2$,
 $p_3(x) = 1 + 3(x - 1) + 3(x - 1)^2 + (x - 1)^3$
 23. $p_3(x) = 1 + \frac{1}{e}(x - e) - \frac{1}{2e^2}(x - e)^2 + \frac{1}{3e^3}(x - e)^3$
 25. a. $p_1(x) = -x, p_2(x) = -x - \frac{x^2}{2}$

27. a. $p_1(x) = \frac{\sqrt{2}}{2} + \frac{\sqrt{2}}{2}\left(x - \frac{\pi}{4}\right)$,
 $p_2(x) = \frac{\sqrt{2}}{2} + \frac{\sqrt{2}}{2}\left(x - \frac{\pi}{4}\right) - \frac{\sqrt{2}}{4}\left(x - \frac{\pi}{4}\right)^2$

 39. a. Approx. 0.52083333 b. Approx. 2.62×10^{-4} (Answers may vary if intermediate calculations are rounded.)

41. $R_n(x) = \frac{\sin^{(n+1)}(c)}{(n+1)!} x^{n+1}$, for c between x and 0

43. $R_n(x) = \frac{(-1)^{n+1}e^{-c}}{(n+1)!} x^{n+1}$, for c between x and 0

45. $R_n(x) = \frac{\sin^{(n+1)}(c)}{(n+1)!} \left(x - \frac{\pi}{2}\right)^{n+1}$, for c between x and $\frac{\pi}{2}$

47. 2.0×10^{-5} 49. 1.6×10^{-5} ($e^{0.25} < 2$) 51. 2.6×10^{-4}

53. With $n = 4$, $|\text{error}| \leq 2.5 \times 10^{-3}$

55. With $n = 2$, $|\text{error}| \leq 4.2 \times 10^{-2}$ ($e^{0.5} < 2$)

57. With $n = 2$, $|\text{error}| \leq 5.4 \times 10^{-3}$ 59. 4 61. 3 63. 1

65. a. False b. True c. True d. True 67. a. C b. E

c. A d. D e. B f. F 69. a. 0.1; 1.7×10^{-4} b. 0.2;

1.3×10^{-3} 71. a. 0.995; 4.2×10^{-6} b. 0.98; 6.7×10^{-5}

73. a. 1.05; 1.3×10^{-3} b. 1.1; 5×10^{-3} 75. a. 1.1; 10^{-2}

b. 1.2; 4×10^{-2}

77. a.

x	$ \sec x - p_2(x) $	$ \sec x - p_4(x) $
-0.2	3.39×10^{-4}	5.51×10^{-6}
-0.1	2.09×10^{-5}	8.51×10^{-8}
0.0	0	0
0.1	2.09×10^{-5}	8.51×10^{-8}
0.2	3.39×10^{-4}	5.51×10^{-6}

b. The errors decrease as $|x|$ decreases.

79. a.

x	$ e^{-x} - p_1(x) $	$ e^{-x} - p_2(x) $
-0.2	2.14×10^{-2}	1.40×10^{-3}
-0.1	5.17×10^{-3}	1.71×10^{-4}
0.0	0	0
0.1	4.84×10^{-3}	1.63×10^{-4}
0.2	1.87×10^{-2}	1.27×10^{-3}

b. The errors decrease as $|x|$ decreases.

81. Centered at $x = 0$, for all n

83. a. $y = f(a) + f'(a)(x - a)$ 85. a. $p_5(x) = x - \frac{x^3}{6} + \frac{x^5}{120}$;
 $q_5(x) = -(x - \pi) + \frac{1}{6}(x - \pi)^3 - \frac{1}{120}(x - \pi)^5$

b. p_5 is a better approximation on $[-\pi, \pi/2]$; q_5 is a better approximation on $(\pi/2, 2\pi]$.

c.

x	$ \sin x - p_5(x) $	$ \sin x - q_5(x) $
$\pi/4$	3.6×10^{-5}	7.4×10^{-2}
$\pi/2$	4.5×10^{-3}	4.5×10^{-3}
$3\pi/4$	7.4×10^{-2}	3.6×10^{-5}
$5\pi/4$	2.3	3.6×10^{-5}
$7\pi/4$	20	7.4×10^{-2}

d. p_5 is a better approximation at $x = \pi/4$; at $x = \pi/2$ the errors are equal.

87. a. $p_1(x) = 6 + \frac{1}{12}(x - 36)$; $q_1(x) = 7 + \frac{1}{14}(x - 49)$

b.

x	$ \sqrt{x} - p_1(x) $	$ \sqrt{x} - q_1(x) $
37	5.7×10^{-4}	6.0×10^{-2}
39	5.0×10^{-3}	4.1×10^{-2}
41	1.4×10^{-2}	2.5×10^{-2}
43	2.6×10^{-2}	1.4×10^{-2}
45	4.2×10^{-2}	6.1×10^{-3}
47	6.1×10^{-2}	1.5×10^{-3}

c. p_1 is a better approximation at $x = 37, 39$, and 41 .

Section 11.2 Exercises, pp. 729–730

1. $c_0 + c_1x + c_2x^2 + c_3x^3$ 3. Ratio and Root Tests 5. The radius of convergence does not change. The interval of convergence may change. 7. $R = 10$; $[-8, 12]$ 9. $R = \frac{1}{2}$; $(-\frac{1}{2}, \frac{1}{2})$
11. $R = 0$; $\{x: x = 0\}$ 13. $R = \infty$; $(-\infty, \infty)$ 15. $R = 3$; $(-3, 3)$
17. $R = \infty$; $(-\infty, \infty)$ 19. $R = 2$; $(-2, 2)$ 21. $R = \infty$; $(-\infty, \infty)$
23. $R = 1$; $(0, 2]$ 25. $R = \frac{1}{4}$; $[0, \frac{1}{2}]$ 27. $R = 5$; $(-3, 7)$
29. $R = \infty$; $(-\infty, \infty)$ 31. $R = \sqrt{3}$; $(-\sqrt{3}, \sqrt{3})$ 33. $R = 1$; $(0, 2)$
35. $R = \infty$; $(-\infty, \infty)$ 37. $R = e$ 39. $R = e^4$
41. $\sum_{k=0}^{\infty} (3x)^k$; $(-\frac{1}{3}, \frac{1}{3})$ 43. $2 \sum_{k=0}^{\infty} x^{k+3}$; $(-1, 1)$
45. $4 \sum_{k=0}^{\infty} x^{k+12}$; $(-1, 1)$ 47. $-\sum_{k=1}^{\infty} \frac{(3x)^k}{k}$; $[-\frac{1}{3}, \frac{1}{3})$
49. $-2 \sum_{k=1}^{\infty} \frac{x^{k+6}}{k}$; $[-1, 1)$ 51. $g(x) = 2 \sum_{k=1}^{\infty} k(2x)^{k-1}$; $(-\frac{1}{2}, \frac{1}{2})$
53. $g(x) = \sum_{k=1}^{\infty} (-1)^k kx^{k-1}$; $(-1, 1)$
55. $g(x) = -\sum_{k=1}^{\infty} \frac{3^k x^k}{k}$; $[-\frac{1}{3}, \frac{1}{3})$
57. $\sum_{k=1}^{\infty} (-1)^{k+1} 2kx^{2k-1}$; $(-1, 1)$ 59. $\sum_{k=0}^{\infty} \left(-\frac{x}{3}\right)^k$; $(-3, 3)$
61. $\ln 2 - \frac{1}{2} \sum_{k=1}^{\infty} \frac{x^{2k}}{k 4^k}$; $(-2, 2)$ 63. a. True b. True c. True
- d. True 65. $|x - a| < R$ 67. $f(x) = \frac{1}{3 - \sqrt{x}}$; $1 < x < 9$
69. $f(x) = \frac{e^x}{e^x - 1}$; $0 < x < \infty$ 71. $f(x) = \frac{3}{4 - x^2}$; $-2 < x < 2$
73. $\sum_{k=0}^{\infty} \frac{(-3x)^k}{k!}$; $-\infty < x < \infty$
75. $\lim_{k \rightarrow \infty} \left| \frac{c_{k+1} x^{k+1}}{c_k x^k} \right| = \lim_{k \rightarrow \infty} \left| \frac{c_{k+1} x^{k+m+1}}{c_k x^{k+m}} \right|$, so by the Ratio Test, the two series have the same radius of convergence.
77. a. $f(x)g(x) = c_0d_0 + (c_0d_1 + c_1d_0)x + (c_0d_2 + c_1d_1 + c_2d_0)x^2$ b. $\sum_{k=0}^n c_k d_{n-k}$

Section 11.3 Exercises, pp. 740–742

1. The n th Taylor polynomial is the n th partial sum of the corresponding Taylor series. 3. $\sum_{k=0}^{\infty} \frac{(x-2)^k}{k!}$ 5. Replace x with x^2 in the Taylor series for $f(x)$; $|x| < 1$. 7. The Taylor series for a function f converges to f on an interval if, for all x in the interval, $\lim_{n \rightarrow \infty} R_n(x) = 0$, where $R_n(x)$ is the remainder at x .
9. a. $1 - 2(x-1) + 3(x-1)^2 - 4(x-1)^3$
- b. $\sum_{k=0}^{\infty} (-1)^k (k+1)(x-1)^k$ c. $(0, 2)$ 11. a. $1 - x + \frac{x^2}{2!} - \frac{x^3}{3!}$
- b. $\sum_{k=0}^{\infty} \frac{(-1)^k x^k}{k!}$ c. $(-\infty, \infty)$ 13. a. $2 + 6x + 12x^2 + 20x^3$
- b. $\sum_{k=0}^{\infty} (k+1)(k+2)x^k$ c. $(-1, 1)$ 15. a. $1 - x^2 + x^4 - x^6$
- b. $\sum_{k=0}^n (-1)^k x^{2k}$ c. $(-1, 1)$ 17. a. $1 + 2x + \frac{(2x)^2}{2!} + \frac{(2x)^3}{3!}$

CHAPTER 12

Section 12.1 Exercises, pp. 763–767

1. Plotting $\{(f(t), g(t)): a \leq t \leq b\}$ generates a curve in the xy -plane.
 3. $x = R \cos(\pi t/5)$, $y = -R \sin(\pi t/5)$ 5. $x = t^2$, $y = t$,
 $-\infty < t < \infty$ 7. $-\frac{1}{2}$ 9. $x = t$, $y = t$, $0 \leq t \leq 6$; $x = 2t$, $y = 2t$,
 $0 \leq t \leq 3$; $x = 3t$, $y = 3t$, $0 \leq t \leq 2$ (answers will vary)

11. a.

t	-10	-4	0	4	10
x	-20	-8	0	8	20
y	-34	-16	-4	8	26

- c. $y = \frac{3}{2}x - 4$
 d. A line segment rising to the right as t increases

13. a.

t	-5	-2	0	2	5
x	11	8	6	4	1
y	-18	-9	-3	3	12

- c. $y = -3x + 15$
 d. A line segment rising to the left as t increases

15. a. $y = -x + 4$ b. A line segment starting at (3, 1) and ending at (4, 0)
 17. a. $y = 3x - 12$ b. A line segment starting at (4, 0) and ending at (8, 12)
 19. a. $x^2 + y^2 = 9$ b. Lower half of a circle of radius 3 centered at (0, 0); starts at (-3, 0) and ends at (3, 0)

21. a. $y = 1 - x^2, -1 \leq x \leq 1$ b. A parabola opening downward with a vertex at (0, 1) starting at (1, 0) and ending at (-1, 0)

23. a. $x^2 + (y - 1)^2 = 1$ b. A circle of radius 1 centered at (0, 1); generated counterclockwise, starting and ending at (1, 1)

25. a. $y = (x + 1)^3$ b. A cubic curve rising to the right as r increases
 27. a. $x^2 + y^2 = 49$ b. A circle of radius 7 centered at (0, 0); generated counterclockwise, starting and ending at (-7, 0)

29. a. $y = 1, -\infty < x < \infty$ b. A horizontal line with y-intercept 1, generated from left to right
 31. $x^2 + y^2 = 4$ 33. $y = \sqrt{4 - x^2}$

35. $y = x^2$ 37. $x = 4 \cos t, y = 4 \sin t, 0 \leq t \leq 2\pi$

39. $x = \cos t + 2, y = \sin t + 3, 0 \leq t \leq 2\pi$

41. $x = 2t, y = 8t; 0 \leq t \leq 1$

43. $x = t, y = 2t^2 - 4; -1 \leq t \leq 5$ 45. $x = 2, y = t; 3 \leq t \leq 9$

47. $x = 4t - 2, y = -6t + 3; 0 \leq t \leq 1$ and

- $x = t + 1, y = 8t - 11; 1 \leq t \leq 2$

49. $x = 1 + 2t, y = 1 + 4t; -\infty < t < \infty$

51. $x = t^2, y = t; t \geq 0$

53. $x = 400 \cos\left(\frac{4\pi t}{3}\right), y = 400 \sin\left(\frac{4\pi t}{3}\right); 0 \leq t \leq 1.5$

55. $x = 50 \cos\left(\frac{\pi t}{12}\right), y(t) = 50 \sin\left(\frac{\pi t}{12}\right); 0 \leq t \leq 24$

63. Plot $x = 1 + \cos^2 t - \sin^2 t$, $y = t$.

65. Approx. 2857 m

67. a. $\frac{dy}{dx} = -2; -2$

69. a. $\frac{dy}{dx} = -8 \cot t; 0$

71. a. $\frac{dy}{dx} = \frac{t^2 + 1}{t^2 - 1}, t \neq 0$; undefined

73. $y = \frac{13}{4}x + \frac{1}{4}$ 75. $y = x - \frac{\pi\sqrt{2}}{4}$ 77. $\left(-\frac{4}{\sqrt{5}}, \frac{8}{\sqrt{5}}\right)$ and $\left(\frac{4}{\sqrt{5}}, -\frac{8}{\sqrt{5}}\right)$ 79. There is no such point. 81. 10 83. $\pi\sqrt{2}$

85. $\frac{1}{3}(5\sqrt{5} - 8)$ 87. $\frac{3}{2}$ 89. a. False b. True c. False

- d. True e. True

91. $0 \leq t \leq 2\pi$

93. $x = 3 \cos t, y = \frac{3}{2} \sin t$, $0 \leq t \leq 2\pi; \left(\frac{x}{3}\right)^2 + \left(\frac{2y}{3}\right)^2 = 1$; in the counterclockwise direction

95. a. Lines intersect at (1, 0). b. Lines are parallel.
 c. Lines intersect at (4, 6).

97.

99.

13.

 $(4, \pi/2), (4, 5\pi/2)$

15.

101.

a. $(0, 2)$ and $(0, -2)$ b. $(1, \sqrt{2}), (1, -\sqrt{2}), (-1, \sqrt{2}), (-1, -\sqrt{2})$

17.

19.

103. 27π 105. $\frac{3\pi}{8}$ 107. a. A circle of radius 3 centered at $(0, 4)$ b. A torus (doughnut); $48\pi^2$ 109. $\frac{64\pi}{3}$ 111. $\int_0^1 2\pi(e^{3t} + 1)\sqrt{4e^{4t} + 9e^{6t}} dt \approx 1445.9$

113. a.

b.

21.

23. $\left(100, -\frac{\pi}{4}\right)$ 25. $(3\sqrt{2}/2, 3\sqrt{2}/2)$ 27. $(1/2, -\sqrt{3}/2)$ 29. $(2\sqrt{2}, -2\sqrt{2})$ 31. $(2\sqrt{2}, \pi/4), (-2\sqrt{2}, 5\pi/4)$ 33. $(2, \pi/3), (-2, 4\pi/3)$ 35. $(8, 2\pi/3), (-8, -\pi/3)$ 37. $x = -4$; vertical line passing through $(-4, 0)$ 39. $x^2 + y^2 = 4$; circle of radius 2 centered at $(0, 0)$ 41. $(x - 1)^2 + (y - 1)^2 = 2$; circle of radius $\sqrt{2}$ centered at $(1, 1)$ 43. $(x - 3)^2 + (y - 4)^2 = 25$; circle of radius 5 centered at $(3, 4)$ 45. $x^2 + (y - 1)^2 = 1$; circle of radius 1 centered at $(0, 1)$ and $x = 0$ 47. $x^2 + (y - 4)^2 = 16$; circle of radius 4 centered at $(0, 4)$ 49. $r = \tan \theta \sec \theta$ 51. $r^2 = \sec \theta \csc \theta$ or $r^2 = 2 \csc 2\theta$

53.

55.

1.

 $(-2, -5\pi/6), (2, 13\pi/6);$
 $(3, \pi/2), (3, 5\pi/2)$ 3. $r^2 = x^2 + y^2, \tan \theta = \frac{y}{x}$ 5. $r \cos \theta = 5$ or $r = 5 \sec \theta$ 7. x -axis symmetry occurs if (r, θ) on the graph implies $(r, -\theta)$ is on the graph. y -axis symmetry occurs if (r, θ) on the graph implies $(r, \pi - \theta) = (-r, -\theta)$ is on the graph. Symmetry about the origin occurs if (r, θ) on the graph implies $(-r, \theta) = (r, \theta + \pi)$ is on the graph.

9.

 $(-2, -3\pi/4), (2, 9\pi/4)$

11.

 $(1, 2\pi/3), (1, 8\pi/3)$

57.

59.

Section 12.2 Exercises, pp. 775–779

61.

65.

69. $[0, 8\pi]$ 73. $[0, 5\pi]$ 

77. a. True b. True c. False d. True e. True

81. A circle of radius 4 and center $(2, \pi/3)$ (polar coordinates)

85. a. 132.3 miles b. 264.6 mi/hr

87.

63.

67.

71. $[0, 2\pi]$ 75. $[0, 2\pi]$ 

91. a. A b. C c. B d. D e. E f. F

93.

95.

97.

99.

103.

For $a = -1$, the spiral winds inward toward the origin.

105. a.

107. a.

109. Symmetry about the x -axis 111. $(x^2 + y^2)^2 = a^2(x^2 - y^2)$

Section 12.3 Exercises, pp. 786–788

1. $x = f(\theta) \cos \theta$, $y = f(\theta) \sin \theta$ 3. The slope of the tangent line is the rate of change of the vertical coordinate with respect to thehorizontal coordinate. 5. $\sqrt{3}$ 7. $\frac{\pi^2}{4}$ 9. Both curves pass throughthe origin, but for different values of θ . 11. 0 13. $-\sqrt{3}$ 15. Undefined, undefined 17. 0 at $(-4, \pi/2)$ and $(-4, 3\pi/2)$,undefined at $(4, 0)$ and $(4, \pi)$ 19. ± 1 21. $\theta = \frac{3\pi}{4}$; $m = -1$ 23. a. $[0, \pi]$ b. $\theta = \frac{\pi}{4}$, $m = 1$; $\theta = \frac{7\pi}{12}$, $m \approx -3.73$; $\theta = \frac{11\pi}{12}$, $m \approx -0.27$

25. Horizontal: $(2\sqrt{2}, \pi/4)$, $(-2\sqrt{2}, 3\pi/4)$; vertical: $(0, \pi/2)$, $(4, 0)$
 27. Horizontal: $(0, 0)$ $(0.943, 0.955)$, $(-0.943, 2.186)$, $(0.943, 4.097)$,
 $(-0.943, 5.328)$; vertical: $(0, 0)$, $(0.943, 0.615)$, $(-0.943, 2.526)$,
 $(0.943, 3.757)$, $(-0.943, 5.668)$ 29. $(2, 0)$ and $(0, 0)$

 $\left(1, \frac{13\pi}{12}\right)$, $\left(1, \frac{17\pi}{12}\right)$, $\left(1, \frac{19\pi}{12}\right)$, and $\left(1, \frac{23\pi}{12}\right)$

33. 1

35. 16π 37. $9\pi/2$ 39. $\frac{\pi}{12}$ 

41. a. $(0, 0)$, $\left(\frac{3}{\sqrt{2}}, \frac{\pi}{4}\right)$ b. $\frac{9}{8}(\pi - 2)$

43. a. $\left(1 + \frac{1}{\sqrt{2}}, \frac{\pi}{4}\right)$, $\left(1 - \frac{1}{\sqrt{2}}, \frac{5\pi}{4}\right)$, $(0, 0)$ b. $\frac{3\pi}{2} - 2\sqrt{2}$

45. $\frac{1}{24}(3\sqrt{3} + 2\pi)$ 47. $\frac{1}{4}(2 - \sqrt{3}) + \frac{\pi}{12}$ 49. $\pi/20$

51. $4(4\pi/3 - \sqrt{3})$ 53. $2\pi/3 - \sqrt{3}/2$ 55. $9\pi + 27\sqrt{3}$

57. 6 59. 18π 61. Intersection points: $\left(3, \pm \frac{\pi}{3}\right)$; area of
 region A = $6\sqrt{3} - 2\pi$; area of region B = $5\pi - 6\sqrt{3}$; area of
 region C = $4\pi + 6\sqrt{3}$ 63. πa 65. $\frac{8}{3}((1 + \pi^2)^{3/2} - 1)$

67. 32 69. $63\sqrt{5}$ 71. $\frac{2\pi - 3\sqrt{3}}{8}$ 73. 26.73

75. a. False b. False c. True

77. Horizontal: $(0, 0)$, $(4.05, 2.03)$, $(9.83, 4.91)$;

vertical: $(1.72, 0.86)$, $(6.85, 3.43)$, $(12.87, 6.44)$ 79. $\frac{\sqrt{1+a^2}}{a}$

81. a. $A_n = \frac{1}{4e^{(4n+2)\pi}} - \frac{1}{4e^{4n\pi}} - \frac{1}{4e^{(4n-2)\pi}} + \frac{1}{4e^{(4n-4)\pi}}$ b. 0

c. $e^{-4\pi}$ 85. $(a^2 - 2)\theta^* + \pi - \sin 2\theta^*$, where $\theta^* = \cos^{-1}(a/2)$

87. $a^2(\pi/2 + a/3)$

Section 12.4 Exercises, pp. 797–800

1. A parabola is the set of all points in a plane equidistant from a fixed point and a fixed line. 3. A hyperbola is the set of all points in a plane whose distances from two fixed points have a constant difference.

5. Parabola:

Ellipse:

7. $\left(\frac{x}{a}\right)^2 + \frac{y^2}{a^2 - c^2} = 1$ 9. $(\pm ae, 0)$ 11. $y = \pm \frac{b}{a}x$

13. Parabola

Hyperbola:

15. Ellipse

Vertices: $(\pm 2, 0)$; foci: $(\pm \sqrt{3}, 0)$;
 major axis has length 4; minor axis
 has length 2.

19. Hyperbola

Vertices: $(\pm 2, 0)$;
 foci: $(\pm \sqrt{5}, 0)$;
 asymptotes: $y = \pm \frac{1}{2}x$

17. Parabola

21. Hyperbola

23. Parabola

25. Ellipse

Vertices: $(0, \pm 4)$;
foci: $(0, \pm 2\sqrt{3})$; major axis has
length 8; minor axis has length 4.

29. Hyperbola

43. $\frac{x^2}{25} + y^2 = 1$ 45. $\frac{x^2}{4} - \frac{y^2}{9} = 1$ 47. $\frac{x^2}{4} + \frac{y^2}{9} = 1$

49. $\frac{x^2}{16} - \frac{y^2}{9} = 1$ 51. a. True b. True c. True d. True

53. $\frac{x^2}{81} + \frac{y^2}{72} = 1$

Directrices: $x = \pm 27$

57.

Vertex: $(2, 0)$; focus: $(0, 0)$;
directrix: $x = 4$

27. Ellipse

Vertices: $(0, \pm \sqrt{7})$; foci:
 $(0, \pm \sqrt{2})$; major axis has length
 $2\sqrt{7}$; minor axis has length $2\sqrt{5}$.

31. $y^2 = 16x$ 33. $y^2 = 12x$

35. $x^2 = -\frac{2}{3}y$

37. $y^2 = 4(x + 1)$

39. $\frac{x^2}{16} + \frac{y^2}{9} = 1$

41. $\frac{x^2}{16} - \frac{y^2}{20} = 1$

55. $x^2 - \frac{y^2}{8} = 1$

59.

Vertices: $(1, 0)$, $(-\frac{1}{3}, 0)$;
center: $(\frac{1}{3}, 0)$; foci: $(0, 0)$, $(\frac{2}{3}, 0)$;
directrices: $x = -1$, $x = \frac{5}{3}$

61.

Vertex: $(0, -\frac{1}{4})$; focus: $(0, 0)$;
directrix: $y = -\frac{1}{2}$

63.

The parabola starts at $(1, 0)$ and
goes through quadrants I, II,
and III for θ in $[0, 3\pi/2]$; then
it approaches $(1, 0)$ by travel-
ing through quadrant IV on
 $(3\pi/2, 2\pi)$.

65.

The parabola begins in the first
quadrant and passes through
the points $(0, 3)$, $(-\frac{3}{2}, 0)$, and
 $(0, -3)$ as θ ranges from 0 to 2π .

67. The parabolas open to the left due to the presence of a positive $\cos \theta$ term in the denominator. As d increases, the directrix $x = d$ moves to the right, resulting in wider parabolas.

69. $y = 2x + 6$ 71. $y = -\frac{3}{40}x - \frac{4}{5}$ 73. $\frac{dy}{dx} = -\frac{b^2x}{a^2y}$, so

$\frac{y - y_0}{x - x_0} = -\frac{b^2x_0}{a^2y_0}$, which is equivalent to the given equation.

75. $r = \frac{4}{1 - 2 \sin \theta}$ 79. $\frac{4\pi b^2 a}{3}$; $\frac{4\pi a^2 b}{3}$; yes, if $a \neq b$

81. a. $\frac{\pi b^2}{3a^2}(a - c)^2(2a + c)$ b. $\frac{4\pi b^4}{3a}$ 91. $2p$

97. a. $u(m) = \frac{2m^2 - \sqrt{3m^2 + 1}}{m^2 - 1}$; $v(m) = \frac{2m^2 + \sqrt{3m^2 + 1}}{m^2 - 1}$;

2 intersection points for $|m| > 1$ b. $\frac{5}{4}, \infty$ c. 2, 2

d. $2\sqrt{3} - \ln(\sqrt{3} + 2)$

Chapter 12 Review Exercises, pp. 800–803

1. a. False b. False c. True d. False e. True f. True

3. $\frac{x^2}{16} + \frac{y^2}{9} = 1$; ellipse generated counterclockwise

5. Segment of the parabola $y = \sqrt{x}$ starting at $(4, 2)$ and ending at $(9, 3)$

7. a. $(x - 1)^2 + (y - 2)^2 = 64$

9. $x = 5(t - 1)(t - 2) \sin t$,
 $y = t$

b. $-\frac{1}{\sqrt{3}}$

c.

11. a. $x^2 + (y + 1)^2 = 9$ b. Lower half of a circle of radius 3 centered at $(0, -1)$, starting at $(3, -1)$ and ending at $(-3, -1)$ c. 0

13. At $t = \pi/6$: $y = (2 + \sqrt{3})x + \left(2 - \frac{\pi}{3} - \frac{\pi\sqrt{3}}{6}\right)$; at

$t = \frac{2\pi}{3}$: $y = \frac{x}{\sqrt{3}} + 2 - \frac{2\pi}{3\sqrt{3}}$ 15. $x = -1 + 2t$, $y = t$,

for $0 \leq t \leq 1$; $x = 1 - 2t$, $y = 1 - t$, for $0 \leq t \leq 1$

17. $x = 3 \sin t$, $y = 3 \cos t$, for $0 \leq t \leq 2\pi$

19. $\frac{4}{15}$ 21. 9.1 23. $4 - 2\sqrt{2}$

33. Liz should choose $r = 1 - \sin \theta$.

35. $(x - 3)^2 + (y + 1)^2 = 10$; a circle of radius $\sqrt{10}$ centered at $(3, -1)$

37. $r = 1 + \cos \theta$; a cardioid

39. $r = 8 \cos \theta$, $0 \leq \theta \leq \pi$

41. a. Horizontal: $\left(\frac{1}{2}, \frac{\pi}{6}\right), \left(\frac{1}{2}, \frac{5\pi}{6}\right), \left(2, \frac{3\pi}{2}\right)$;

vertical: $\left(\frac{3}{2}, \frac{7\pi}{6}\right), \left(\frac{3}{2}, \frac{11\pi}{6}\right), \left(0, \frac{\pi}{2}\right)$ b. Undefined

43. $\left(\frac{\pi}{12}, \frac{1}{2^{1/4}}\right), \left(\frac{3\pi}{4}, \frac{1}{2^{1/4}}\right), \left(\frac{17\pi}{12}, \frac{1}{2^{1/4}}\right), (0, 0)$

45. $\pi - \frac{3\sqrt{3}}{2}$ 47. $2\sqrt{3} - \frac{2\pi}{3}$ 49. 4 51. 40.09

53. a. Hyperbola

b. Foci $(\pm\sqrt{3}, 0)$, vertices $(\pm 1, 0)$, directrices $x = \pm \frac{1}{\sqrt{3}}$

c. $e = \sqrt{3}$

55. a. Hyperbola

b. Foci $(0, \pm 2\sqrt{5})$, vertices $(0, \pm 4)$, directrices

$y = \pm \frac{8}{\sqrt{5}}$ c. $e = \frac{\sqrt{5}}{2}$

57. a. Ellipse

b. Foci $(\pm\sqrt{2}, 0)$, vertices $(\pm 2, 0)$, directrices

$x = \pm 2\sqrt{2}$ c. $e = \frac{\sqrt{2}}{2}$

59. $y = \frac{3}{2}x - 2$

61. $e = 1$

63. $e = \frac{1}{2}$

65. $\frac{y^2}{4} - \frac{x^2}{12} = 1$

67. $\frac{y^2}{16} + \frac{25x^2}{336} = 1$; foci: $\left(0, \pm \frac{8}{5}\right)$

69. $e = 2/3$, $y = \pm 9$, $(\pm 2\sqrt{5}, 0)$ 71. $m = \frac{b}{a}$

75. a. $x = \pm a \cos^{2/n} t$, $y = \pm b \sin^{2/n} t$

c. The curve becomes more rectangular as n increases.

CHAPTER 13

Section 13.1 Exercises, pp. 813–816

3. There are infinitely many vectors with the same direction and length as $\mathbf{v}$. 5. $\mathbf{u} + \mathbf{v} = \langle u_1 + v_1, u_2 + v_2 \rangle$ 7. No

9. $|\langle v_1, v_2 \rangle| = \sqrt{v_1^2 + v_2^2}$ 11. If P has coordinates (x_1, y_1) and Q has coordinates (x_2, y_2) , then the magnitude of $\overrightarrow{PQ}$ is given by

$\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$. 13. a, c, e 15. a. $3\mathbf{v}$ b. $2\mathbf{u}$
c. $-3\mathbf{u}$ d. $-2\mathbf{u}$ e. $\mathbf{v}$ 17. a. $3\mathbf{u} + 3\mathbf{v}$ b. $\mathbf{u} + 2\mathbf{v}$ c. $2\mathbf{u} + 5\mathbf{v}$
d. $-2\mathbf{u} + 3\mathbf{v}$ e. $3\mathbf{u} + 2\mathbf{v}$ f. $-3\mathbf{u} - 2\mathbf{v}$ g. $-2\mathbf{u} - 4\mathbf{v}$
h. $\mathbf{u} - 4\mathbf{v}$ i. $-\mathbf{u} - 6\mathbf{v}$

19. a.

$$\overrightarrow{OP} = \langle 3, 2 \rangle = 3\mathbf{i} + 2\mathbf{j}$$

$$|\overrightarrow{OP}| = \sqrt{13}$$

b.

$$\overrightarrow{PQ} = \langle -1, 0 \rangle = -\mathbf{i}$$

$$|\overrightarrow{PQ}| = 1$$

c.

$$\overrightarrow{RQ} = \langle 10, 3 \rangle = 10\mathbf{i} + 3\mathbf{j}$$

$$|\overrightarrow{RQ}| = \sqrt{109}$$

21. $\overrightarrow{QU} = \langle 7, 2 \rangle$, $\overrightarrow{PT} = \langle 7, 3 \rangle$, $\overrightarrow{RS} = \langle 2, 3 \rangle$

23. $\overrightarrow{QT}$ 25. $\langle -4, 10 \rangle$ 27. $\langle 52, -30 \rangle$ 29. $2\sqrt{2}$

31. $\mathbf{w} - \mathbf{u}$ 33. $13\left\langle -\frac{5}{13}, \frac{12}{13} \right\rangle$ 35. $\langle 3, 3\sqrt{3} \rangle$

37. $\left\langle \frac{15}{13}, -\frac{36}{13} \right\rangle$ 39. $\left\langle \frac{30}{\sqrt{13}}, -\frac{20}{\sqrt{13}} \right\rangle$ 41. $-\mathbf{i} + 10\mathbf{j}$

43. $\pm \frac{1}{\sqrt{61}} \langle 6, 5 \rangle$ 45. $\left\langle -\frac{28}{\sqrt{74}}, \frac{20}{\sqrt{74}} \right\rangle, \left\langle \frac{28}{\sqrt{74}}, -\frac{20}{\sqrt{74}} \right\rangle$

47. a. $\left\langle \frac{3}{5}, -\frac{4}{5} \right\rangle, \left\langle -\frac{3}{5}, \frac{4}{5} \right\rangle$ b. $b = \pm \frac{2\sqrt{2}}{3}$ c. $a = \pm \frac{3}{\sqrt{10}}$

49. $\langle -4\sqrt{3}, 4 \rangle$ 51. $\langle 15\sqrt{3}, -15 \rangle$ 53. a. $\mathbf{v}_a = \langle -320, 0 \rangle$;
 $\mathbf{w} = \langle -20\sqrt{2}, -20\sqrt{2} \rangle$; $\mathbf{v}_g = \langle -320 - 20\sqrt{2}, -20\sqrt{2} \rangle$

b. Approx. 349.4 mi/hr; approx. 4.6° south of west

55. Approx. 490.3 mi/hr with a heading of about 1.2° west of north

57. $5\sqrt{65}$ km/hr ≈ 40.3 km/hr 59. 1 m/s in the direction 30° east of north

61. a. $\langle 20, 20\sqrt{3} \rangle$ b. Yes c. No 63. $250\sqrt{2}$ lb

65. a. True b. True c. False d. False e. False f. False

g. False h. True 67. $\mathbf{x} = \left\langle \frac{1}{5}, -\frac{3}{10} \right\rangle$ 69. $\mathbf{x} = \left\langle \frac{4}{3}, -\frac{11}{3} \right\rangle$

71. $4\mathbf{i} - 8\mathbf{j}$ 73. $\langle a, b \rangle = \left(\frac{a+b}{2} \right) \mathbf{u} + \left(\frac{b-a}{2} \right) \mathbf{v}$

75. a. $\mathbf{0}$ b. The 6:00 vector c. Sum any six consecutive vectors.

d. A vector pointing from 12:00 to 6:00 with a length 12 times the radius of the clock

77. $\mathbf{u} + \mathbf{v} = \langle u_1, u_2 \rangle + \langle v_1, v_2 \rangle = \langle u_1 + v_1, u_2 + v_2 \rangle$
 $= \langle v_1 + u_1, v_2 + u_2 \rangle = \langle v_1, v_2 \rangle + \langle u_1, u_2 \rangle$
 $= \mathbf{v} + \mathbf{u}$

79. $a(c\mathbf{v}) = a(c\langle v_1, v_2 \rangle) = a\langle cv_1, cv_2 \rangle$
 $= \langle acv_1, acv_2 \rangle = \langle (ac)v_1, (ac)v_2 \rangle$
 $= ac\langle v_1, v_2 \rangle = (ac)\mathbf{v}$

81. $(a + c)\mathbf{v} = (a + c)\langle v_1, v_2 \rangle$
 $= \langle (a + c)v_1, (a + c)v_2 \rangle$
 $= \langle av_1 + cv_1, av_2 + cv_2 \rangle$
 $= \langle av_1, av_2 \rangle + \langle cv_1, cv_2 \rangle$
 $= a\langle v_1, v_2 \rangle + c\langle v_1, v_2 \rangle$
 $= a\mathbf{v} + c\mathbf{v}$

85. a. $\{\mathbf{u}, \mathbf{v}\}$ are linearly dependent. $\{\mathbf{u}, \mathbf{w}\}$ and $\{\mathbf{v}, \mathbf{w}\}$ are linearly independent. b. Two linearly dependent vectors are parallel. Two linearly independent vectors are not parallel. 87. a. $\frac{5}{3}$ b. -15

Section 13.2 Exercises, pp. 823–827

1. Move 3 units from the origin in the direction of the positive x -axis, then 2 units in the direction of the negative y -axis, and then 1 unit in the direction of the positive z -axis. 3. It is parallel to the yz -plane and contains the point $(4, 0, 0)$. 5. $\mathbf{u} + \mathbf{v} = \langle 9, 0, -6 \rangle$;

$3\mathbf{u} - \mathbf{v} = \langle 3, 20, -22 \rangle$ 7. $(0, 0, -4)$ 9. $A(3, 0, 5), B(3, 4, 0), C(0, 4, 5)$ 11. $A(3, -4, 5), B(0, -4, 0), C(0, -4, 5)$

13. a.

b.

c.

15.

17.

19.

21.

23. $(x - 1)^2 + (y - 2)^2 + (z - 3)^2 = 16$

25. $(x + 2)^2 + y^2 + (z - 4)^2 \leq 1$

27. $(x - \frac{3}{2})^2 + (y - \frac{3}{2})^2 + (z - 7)^2 = \frac{13}{2}$ 29. A sphere centered at $(1, 0, 0)$ with radius 3 31. A sphere centered at $(0, 1, 2)$ with radius 3 33. All points on or outside the sphere with center $(0, 7, 0)$ and radius 6 35. The ball centered at $(4, 7, 9)$ with radius 15

37. The single point $(1, -3, 0)$ 39. a. $\langle 12, -7, 2 \rangle$ b. $\langle 16, -13, -1 \rangle$ c. 5 41. a. $\langle -4, 5, -4 \rangle$ b. $\langle -9, 3, -9 \rangle$ c. $3\sqrt{2}$ 43. a. $\langle -15, 23, 22 \rangle$ b. $\langle -31, 49, 33 \rangle$ c. $3\sqrt{5}$ 45. a. $\vec{PQ} = \langle 2, 6, 2 \rangle = 2\mathbf{i} + 6\mathbf{j} + 2\mathbf{k}$ b. $|\vec{PQ}| = 2\sqrt{11}$ c. $\left\langle \frac{1}{\sqrt{11}}, \frac{3}{\sqrt{11}}, \frac{1}{\sqrt{11}} \right\rangle$ and $\left\langle -\frac{1}{\sqrt{11}}, -\frac{3}{\sqrt{11}}, -\frac{1}{\sqrt{11}} \right\rangle$ 47. a. $\vec{PQ} = \langle 0, -5, 1 \rangle = -5\mathbf{j} + \mathbf{k}$ b. $|\vec{PQ}| = \sqrt{26}$ c. $\left\langle 0, -\frac{5}{\sqrt{26}}, \frac{1}{\sqrt{26}} \right\rangle$ and $\left\langle 0, \frac{5}{\sqrt{26}}, -\frac{1}{\sqrt{26}} \right\rangle$ 49. a. $\vec{PQ} = \langle -2, 4, -2 \rangle = -2\mathbf{i} + 4\mathbf{j} - 2\mathbf{k}$ b. $|\vec{PQ}| = 2\sqrt{6}$ c. $\left\langle -\frac{1}{\sqrt{6}}, \frac{2}{\sqrt{6}}, -\frac{1}{\sqrt{6}} \right\rangle$ and $\left\langle \frac{1}{\sqrt{6}}, -\frac{2}{\sqrt{6}}, \frac{1}{\sqrt{6}} \right\rangle$ 51. a. $20\mathbf{i} + 20\mathbf{j} - 10\mathbf{k}$; b. 30 mi/hr

53. The speed of the plane is approximately 220 mi/hr; the direction is slightly south of east and upward.

55. $5\sqrt{6}$ knots to the east, $5\sqrt{6}$ knots to the north, 10 knots upward

57. a. False b. False c. False d. True 59. All points in $\mathbb{R}^3$ except those on the coordinate axes 61. A circle of radius 1 centered at $(0, 0, 0)$ in the xy -plane

63. A circle of radius 2 centered at $(0, 0, 1)$ in the horizontal plane

$z = 1$ 65. $(x - 2)^2 + (z - 1)^2 = 9, y = 4$ 67. $6\left\langle \frac{1}{3}, -\frac{2}{3}, \frac{2}{3} \right\rangle$

69. $\left\langle -\frac{15}{4}, \frac{5}{2}, -\frac{5\sqrt{3}}{4} \right\rangle$ 71. $\langle 12, -16, 0 \rangle, \langle -12, 16, 0 \rangle$

73. $\langle -\sqrt{3}, -\sqrt{3}, \sqrt{3} \rangle, \langle \sqrt{3}, \sqrt{3}, -\sqrt{3} \rangle$ 75. a. Collinear; Q is between P and R . b. Collinear; P is between Q and R .

c. Noncollinear d. Noncollinear 77. $\left\langle \frac{500\sqrt{3}}{9}, 0, -\frac{500}{3} \right\rangle,$

$\left\langle -\frac{250\sqrt{3}}{9}, -\frac{250}{3}, -\frac{500}{3} \right\rangle, \left\langle -\frac{250\sqrt{3}}{9}, \frac{250}{3}, -\frac{500}{3} \right\rangle$

79. $(3, 8, 9), (-1, 0, 3), (1, 0, -3)$

Section 13.3 Exercises, pp. 833–837

1. $\mathbf{u} \cdot \mathbf{v} = |\mathbf{u}||\mathbf{v}| \cos \theta$ 3. -40 5. $\cos \theta = \frac{\mathbf{u} \cdot \mathbf{v}}{|\mathbf{u}||\mathbf{v}|}$, so

$\theta = \cos^{-1}\left(\frac{\mathbf{u} \cdot \mathbf{v}}{|\mathbf{u}||\mathbf{v}|}\right)$ 7. $\left\langle -\frac{4}{3}, \frac{2}{3}, \frac{4}{3} \right\rangle$ 9. -1 11. 2

13. $\frac{\pi}{2}; 0$ 15. 100; $\frac{\pi}{4}$ 17. $\frac{1}{2}$ 19. 0; $\frac{\pi}{2}$ 21. 1; $\pi/3$

23. $-2; 93.2^\circ$ 25. 2; 87.2° 27. $-4; 104^\circ$ 29. $\angle P = 78.8^\circ,$
 $\angle Q = 47.2^\circ, \angle R = 54.0^\circ$ 31. $\langle 3, 0 \rangle; 3$ 33. $\langle 0, 3 \rangle; 3$

35. $\frac{6}{5}\langle -2, 1 \rangle; \frac{6}{\sqrt{5}}$ 37. $\frac{14}{19}\langle -1, -3, 3 \rangle; -\frac{14}{\sqrt{19}}$

39. $-\mathbf{i} + \mathbf{j} - 2\mathbf{k}; \sqrt{6}$ 41. $750\sqrt{3}$ ft-lb 43. $25\sqrt{2}$ J

45. 400 J 47. $\frac{1}{2}\langle 5\sqrt{3}, -15 \rangle, \frac{1}{2}\langle -5\sqrt{3}, -5 \rangle$ 49. $\langle 490, -490 \rangle,$
 $\langle -490, -490 \rangle$ 51. a. False b. True c. True d. False

e. False f. True 53. $c = \frac{4}{9}$ 55. $\langle 1, a, 4a - 2 \rangle, a$ real

57. a. $\text{proj}_{\mathbf{k}} \mathbf{u} = |\mathbf{u}| \cos 60^\circ \left(\frac{\mathbf{k}}{|\mathbf{k}|}\right) = \frac{1}{2}\mathbf{k}$, for all such $\mathbf{u}$ b. Yes

59. The heads of the vectors lie on the line $y = 3 - x$.61. The heads of the vectors lie on the plane $z = 3$.

63. $\mathbf{u} = \left\langle -\frac{4}{5}, -\frac{2}{5} \right\rangle + \left\langle -\frac{6}{5}, \frac{12}{5} \right\rangle$

65. $\mathbf{u} = \left\langle 1, \frac{1}{2}, \frac{1}{2} \right\rangle + \left\langle -2, \frac{3}{2}, \frac{5}{2} \right\rangle$ 67. $3x - 7y = -36$

69. $-\frac{5}{3}$ 71. $\mathbf{I} = \frac{1}{\sqrt{2}}\mathbf{i} + \frac{1}{\sqrt{2}}\mathbf{j}, \mathbf{J} = -\frac{1}{\sqrt{2}}\mathbf{i} + \frac{1}{\sqrt{2}}\mathbf{j};$

$\mathbf{i} = \frac{1}{\sqrt{2}}(\mathbf{I} - \mathbf{J}), \mathbf{j} = \frac{1}{\sqrt{2}}(\mathbf{I} + \mathbf{J})$ 73. a. $|\mathbf{I}| = |\mathbf{J}| = |\mathbf{K}| = 1$

b. $\mathbf{I} \cdot \mathbf{J} = 0, \mathbf{I} \cdot \mathbf{K} = 0, \mathbf{J} \cdot \mathbf{K} = 0$ c. $\langle 1, 0, 0 \rangle = \frac{1}{2}\mathbf{I} - \frac{1}{\sqrt{2}}\mathbf{J} + \frac{1}{2}\mathbf{K}$

75. a. The faces on $y = 0$ and $z = 0$ b. The faces on $y = 1$ and $z = 1$ c. The faces on $x = 0$ and $x = 1$ d. 0 e. 1 f. 2

77. a. $\left(\frac{2}{\sqrt{3}}, 0, \frac{2\sqrt{2}}{\sqrt{3}}\right)$ b. $\mathbf{r}_{OP} = \langle \sqrt{3}, -1, 0 \rangle, \mathbf{r}_{OQ} = \langle \sqrt{3}, 1, 0 \rangle,$

$\mathbf{r}_{PQ} = \langle 0, 2, 0 \rangle, \mathbf{r}_{OR} = \left\langle \frac{2}{\sqrt{3}}, 0, \frac{2\sqrt{2}}{\sqrt{3}} \right\rangle, \mathbf{r}_{PR} = \left\langle -\frac{\sqrt{3}}{3}, 1, \frac{2\sqrt{2}}{\sqrt{3}} \right\rangle$

83. a. $\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma$

$$= \left(\frac{\mathbf{v} \cdot \mathbf{i}}{|\mathbf{v}| |\mathbf{i}|} \right)^2 + \left(\frac{\mathbf{v} \cdot \mathbf{j}}{|\mathbf{v}| |\mathbf{j}|} \right)^2 + \left(\frac{\mathbf{v} \cdot \mathbf{k}}{|\mathbf{v}| |\mathbf{k}|} \right)^2$$

$$= \frac{a^2}{a^2 + b^2 + c^2} + \frac{b^2}{a^2 + b^2 + c^2} + \frac{c^2}{a^2 + b^2 + c^2} = 1$$

b. $\langle 1, 1, 0 \rangle, 90^\circ$ c. $\left\langle \frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}, 1 \right\rangle, 45^\circ$ d. No. If so,

$\left(\frac{\sqrt{3}}{2}\right)^2 + \left(\frac{\sqrt{3}}{2}\right)^2 + \cos^2 \gamma = 1$, which has no solution. e. 54.7°

85. $|\mathbf{u} \cdot \mathbf{v}| = 33 = \sqrt{33} \cdot \sqrt{33} < \sqrt{70} \cdot \sqrt{74} = |\mathbf{u}| |\mathbf{v}|$

Section 13.4 Exercises, pp. 842–844

1. 0 3. a. $\mathbf{u}$ is orthogonal to $\mathbf{v}$. b. $\mathbf{u}$ is parallel to $\mathbf{v}$. 5. $\sqrt{2}/2$

7. $-3\mathbf{i} - 2\mathbf{j} + 7\mathbf{k}$ 9. $\mathbf{u} \times \mathbf{v} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \end{vmatrix}$ 11. $15\mathbf{k}$

13. 0

15. 18

17. $\mathbf{i}$

19. $-\mathbf{i}$

21. $6\mathbf{j}$

23. $\mathbf{u} \times \mathbf{v} = \langle -30, 18, 9 \rangle, \mathbf{v} \times \mathbf{u} = \langle 30, -18, -9 \rangle$

25. $\mathbf{u} \times \mathbf{v} = \langle 6, 11, 5 \rangle, \mathbf{v} \times \mathbf{u} = \langle -6, -11, -5 \rangle$

27. $\mathbf{u} \times \mathbf{v} = \langle 8, 4, 10 \rangle, \mathbf{v} \times \mathbf{u} = \langle -8, -4, -10 \rangle$ 29. 11

31. $3\sqrt{10}$ 33. $\sqrt{11}/2$ 35. $4\sqrt{2}$ 37. $9\sqrt{2}$ 41. Not collinear

43. $\langle 3, -4, 2 \rangle$ 45. $\langle 0, 20, -20 \rangle$ 47. The force $\mathbf{F} = 5\mathbf{i} - 5\mathbf{k}$ produces the greater torque. 49. $5/\sqrt{2}$ N-m 51. $|\tau| = 13.2$ N-m; direction: into the page

53. The magnitude is $20\sqrt{2}$ at a 135° angle with the positive x -axis in the xy -plane.

55. 4.53×10^{-14} kg-m/s² 57. a. False b. False c. False

d. True e. False 59. $\langle u_1, u_1 + 2, u_1 + 1 \rangle, u_1$ real

61. $\frac{\sqrt{(ab)^2 + (ac)^2 + (bc)^2}}{2}$

63. $|\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})| = |\mathbf{u}| |\mathbf{v} \times \mathbf{w}| |\cos \theta|$, where $|\mathbf{v} \times \mathbf{w}|$ is the area of the base of the parallelepiped and $|\mathbf{u}| |\cos \theta|$ is its height.

67. 1.76×10^7 m/s

Section 13.5 Exercises, pp. 852–855

1. $\langle 4, -8, 9 \rangle$ 3. $\langle x_1 - x_0, y_1 - y_0, z_1 - z_0 \rangle$ 5. Perpendicular

7. A point and a normal vector 9. $(-6, 0, 0), (0, -4, 0), (0, 0, 3)$

11. $x = 4t, y = 7t, z = 1; \mathbf{r} = \langle 0, 0, 1 \rangle + t\langle 4, 7, 0 \rangle$

13. $x = 0, y = t, z = 1; \mathbf{r} = \langle 0, 0, 1 \rangle + t\langle 0, 1, 0 \rangle$

15. $x = t, y = 2t, z = 3t; \mathbf{r} = t\langle 1, 2, 3 \rangle$

17. $x = -2t, y = 8t, z = -4t; \mathbf{r} = t\langle -2, 8, -4 \rangle$

19. $x = -2t, y = -t, z = t; \mathbf{r} = t\langle -2, -1, 1 \rangle$

21. $x = -2, y = 5 - 2t, z = 3 - t; \mathbf{r} = \langle -2, 5, 3 \rangle + t\langle 0, -2, -1 \rangle$ 23. $x = 1 - 4t, y = 2 + 6t, z = 3 + 14t;$

$\mathbf{r} = \langle 1, 2, 3 \rangle + t\langle -4, 6, 14 \rangle$ 25. $x = 4, y = 3 - 9t, z = 3 + 6t;$

$\mathbf{r} = \langle 4, 3, 3 \rangle + t\langle 0, -9, 6 \rangle$ 27. $x = t, y = 2t, z = 3t, 0 \leq t \leq 1$

29. $x = 2 + 5t, y = 4 + t, z = 8 - 5t, 0 \leq t \leq 1$ 31. Intersect

at $(1, 3, 2)$ 33. Skew 35. Same line 37. Parallel, distinct lines

39. 13 41. a. Yes b. No c. $13.16^\circ < \theta < 18.12^\circ$

43. $x + y - z = 4$ 45. $2x + y - 2z = -2$

47. $x + 4y + 7z = 0$ 49. $7x + 2y + z = 10$

51. $-x + 2y - 4z = -17$ 53. $3y - 2z = 0$

55. $8x - 7y + 2z = 0$ 57. $x + 3y - z = -3$

59. Yes; $2x - y = -1$

61. Intercepts $x = 2, y = -3, z = 6;$

$3x - 2y = 6, z = 0;$

$-2y + z = 6, x = 0;$ and

$3x + z = 6, y = 0$

63. Intercepts

$x = 30, y = 10, z = -6;$

$x + 3y = 30, z = 0;$

$x - 5z = 30, y = 0;$ and

$3y - 5z = 30, x = 0$

65. Orthogonal 67. Neither 69. Q and T are identical; Q, R , and T are parallel; S is orthogonal to Q, R , and T .

71. $\mathbf{r} = \langle 2 + 2t, 1 - 4t, 3 + t \rangle$

73. $x = t, y = 1 + 2t, z = -1 - 3t$

75. $x = \frac{7}{5} + 2t, y = \frac{9}{5} + t, z = -t$ 77. (3, 3, 3) 79. (1, 1, 2)

81. a. True b. False c. False d. True e. False f. False

g. True 83. 6 85. $\frac{x-1}{4} = \frac{y-2}{7} = \frac{z}{2}$ 87. Approx. 43°

89. $6x - 4y + z = d$ 91. The planes intersect in the point (3, 6, 0).

93. a.

b. Positive

c. $2x + y = 40$, line in the xy -plane

Section 13.6 Exercises, pp. 863–865

1. z -axis; x -axis; y -axis 3. Intersection of the surface with a plane parallel to one of the coordinate planes 5. Ellipsoid

7. a. x -axis

b.

9. a. y -axis

b.

11. a. z -axis

b.

13. a. x -axis

b.

15. Ellipsoid; xy -trace: $x^2 + y^2 = 1$ (circle); xz -trace:

$x^2 + \frac{z^2}{25} = 1$ (ellipse); yz -trace: $y^2 + \frac{z^2}{25} = 1$ (ellipse)

17. Paraboloid; xy -trace: (0, 0, 0) (a single point); xz -trace:

$z = 25x^2$ (parabola); yz -trace: $z = 25y^2$ (parabola) 19. Hyperboloid of two sheets; xz -trace: $z^2 - 25x^2 = 25$ (hyperbola);

yz -trace: $z^2 - 25y^2 = 25$ (hyperbola) 21. Hyperbolic paraboloid

23. Elliptic paraboloid 25. Hyperbolic cylinder

27. Elliptic paraboloid

29. a. $x = \pm 1, y = \pm 2, z = \pm 3$

b. $x^2 + \frac{y^2}{4} = 1, x^2 + \frac{z^2}{9} = 1,$

$\frac{y^2}{4} + \frac{z^2}{9} = 1$

c. Ellipsoid

31. a. $x = y = z = 0$

b. $x = y^2, x = z^2$, origin

c. Elliptic paraboloid

33. a. $x = \pm 5, y = \pm 3$, no z -intercept

b. $\frac{x^2}{25} + \frac{y^2}{9} = 1, \frac{x^2}{25} - z^2 = 1, \frac{y^2}{9} - z^2 = 1$

c. Hyperboloid of one sheet

35. a. $x = y = z = 0$ b. $\frac{x^2}{9} - y^2 = 0, z = \frac{x^2}{9}, z = -y^2$

c. Hyperbolic paraboloid

37. a. $x = y = z = 0$

b. Origin, $\frac{y^2}{4} = z^2, x^2 = z^2$

c. Elliptic cone

41. a. $x = y = z = 0$

b. Origin,

$x - 9y^2 = 0, 9x - \frac{z^2}{4} = 0$

c. Elliptic paraboloid

45. a. $x = y = z = 0$

b. $5x - \frac{y^2}{5} = 0, 5x + \frac{z^2}{20} = 0,$

$-\frac{y^2}{5} + \frac{z^2}{20} = 0$

c. Hyperbolic paraboloid

39. a. $x = \pm 3, y = \pm 1, z = \pm 6$

b. $\frac{x^2}{3} + 3y^2 = 3, \frac{x^2}{3} + \frac{z^2}{12} = 3,$

$3y^2 + \frac{z^2}{12} = 3$

c. Ellipsoid

43. a. No x-intercept,

$y = \pm 12, z = \pm \frac{1}{2}$

b. $-\frac{x^2}{4} + \frac{y^2}{16} = 9,$

$-\frac{x^2}{4} + 36z^2 = 9, \frac{y^2}{16} + 36z^2 = 9$

c. Hyperboloid of one sheet

47. a. $x = y = z = 0$

b. $\frac{y^2}{18} = 2x^2, \frac{z^2}{32} = 2x^2,$ origin

c. Elliptic cone

49. a. No x-intercept, $y = \pm 2,$ no z-intercept

b. $-x^2 + \frac{y^2}{4} = 1,$ no xz-trace, $\frac{y^2}{4} - \frac{z^2}{9} = 1$

c. Hyperboloid of two sheets

51. a. No x-intercept, $y = \pm \frac{\sqrt{3}}{3},$ no z-intercept

b. $-\frac{x^2}{3} + 3y^2 = 1,$ no xz-trace, $3y^2 - \frac{z^2}{12} = 1$

c. Hyperboloid of two sheets

53. The graph of the ellipsoid $x^2 + 4y^2 + 9z^2 + 54z = 19$ is obtained by shifting the graph of the ellipsoid $x^2 + 4y^2 + 9z^2 = 100$ down 3 units.

55. Hyperboloid of one sheet 57. Hyperboloid of two sheets

59. a. True b. True c. True d. False e. False 61. All except

the hyperbolic paraboloid 63. 8 65. b. $\frac{x^2 + z^2}{(10.55/\pi)^2} + \frac{y^2}{(5.55)^2} = 1$

67. $4x^2 + 8y^2 + 4(z - 3)^2 = 9, 3 \leq z \leq 4.5$

Chapter 13 Review Exercises, pp. 865–867

1. a. True b. False c. True d. False e. True f. True

3. $\langle 3, -6 \rangle$ 5. $\langle -5, 8 \rangle$ 7. $\sqrt{221}$ 9. $12\langle \frac{1}{3}, -\frac{2}{3}, \frac{2}{3} \rangle$

CHAPTER 14

Section 14.1 Exercises, pp. 873–875

1. One 3. Its output is a vector.

5. $\lim_{t \rightarrow a} \mathbf{r}(t) = \langle \lim_{t \rightarrow a} f(t), \lim_{t \rightarrow a} g(t), \lim_{t \rightarrow a} h(t) \rangle$

7. $\mathbf{r}(t) = t\mathbf{i} + 2t\mathbf{j} + 3t\mathbf{k}$

9. $\mathbf{r}(t) = \langle 2 + 2t, 3 + 3t, 7 - 4t \rangle$

11. $\mathbf{r}(t) = \langle 3 + 2t, 4, 5 - t \rangle$

13. $\mathbf{r}(t) = \langle 1 - t, 2, 1 + 2t \rangle$, for $0 \leq t \leq 1$

15.

17.

19.

21.

23.

25.

27.

29. When viewed from above, the curve is a portion of the parabola $y = x^2$.

31. $-i - 4j + k$ 33. $-2j + \frac{\pi}{2}k$ 35. i 37. a. True b. False

c. True d. True 39. $\{t : |t| \leq 2\}$ 41. $\{t : 0 \leq t \leq 2\}$

43. (4, 8, 16) 45. a. E b. D c. F d. C e. A f. B

47. $r(t) = \langle 2 \cos t, 2 \sin t, 4 \rangle$

49. $r(t) = \langle 5 \cos t, 5 \sin t, 10 \cos t + 10 \sin t \rangle$

51. a. Ball has a parabolic trajectory in the yz -plane; 1200 ft

b. Approx. 1199.7 ft c. 1196 ft 53. Hyperboloid of one sheet

55. Ellipsoid 57. (4, 2, 2); $\sqrt{179}$

59.

The curve lies on the sphere $x^2 + y^2 + z^2 = 1$.

61. $\frac{2\pi}{(m, n)}$, where (m, n) = greatest common factor of m and n

63. a.

b. Curve is a tilted circle of radius 1 centered at the origin.

65. $\langle cf - ed, be - af, ad - bc \rangle$ or any scalar multiple

Section 14.2 Exercises, pp. 881–883

1. $r'(t) = \langle f'(t), g'(t), h'(t) \rangle$ 3. $T(t) = \frac{r'(t)}{|r'(t)|}$

5. $\int r(t) dt = \left(\int f(t) dt \right) i + \left(\int g(t) dt \right) j + \left(\int h(t) dt \right) k$

7. $C = \langle -1, -3, -10 \rangle$ 9. $\langle -\sin t, 2t, \cos t \rangle$

11. $\left\langle 6t^2, \frac{3}{\sqrt{t}}, -\frac{3}{t^2} \right\rangle$ 13. $e^t i - 2e^{-t} j - 8e^{2t} k$

15. $\langle e^{-t}(1-t), 1 + \ln t, \cos t - t \sin t \rangle$

17. $\langle 1, 6, 3 \rangle$ 19. $\langle 1, 0, 0 \rangle$ 21. $8i + 9j - 10k$

23. $\langle 2/3, 2/3, 1/3 \rangle$

25. $\frac{\langle 0, -\sin 2t, 2 \cos 2t \rangle}{\sqrt{1 + 3 \cos^2 2t}}$ 27. $\frac{t^2}{\sqrt{t^4 + 4}} \left\langle 1, 0, -\frac{2}{t^2} \right\rangle$

29. $\langle 0, 0, -1 \rangle$ 31. $\left\langle \frac{2}{\sqrt{5}}, 0, -\frac{1}{\sqrt{5}} \right\rangle$

33. $\langle 30t^{14} + 24t^3, 14t^{13} - 12t^{11} + 9t^2 - 3, -96t^{11} - 24 \rangle$

35. $4t(2t^3 - 1)(t^3 - 2) \langle 3t(t^3 - 2), 1, 0 \rangle$

37. $e^t(2t^3 + 6t^2) - 2e^{-t}(t^2 - 2t - 1) - 16e^{-2t}$

39. 11 41. $\langle 0, 7, 1 \rangle$ 43. $\langle 2e^{2t}, -2e^t, 0 \rangle$ 45. $\left\langle 4, -\frac{2}{\sqrt{t}}, 0 \right\rangle$

47. $\langle 1 + 6t^2, 4t^3, -2 - 3t^2 \rangle$ 49. $5te^t(t + 2) - 6t^2e^{-t}(t - 3)$

51. $-3t^2 \sin t + 6t \cos t + 2\sqrt{t} \cos 2t + \frac{1}{2\sqrt{t}} \sin 2t$

53. $\langle 2, 0, 0 \rangle, \langle 0, 0, 0 \rangle$ 55. $\langle -9 \cos 3t, -16 \sin 4t, -36 \cos 6t \rangle, \langle 27 \sin 3t, -64 \cos 4t, 216 \sin 6t \rangle$

57. $\left\langle -\frac{1}{4}(t + 4)^{-3/2}, -2(t + 1)^{-3}, 2e^{-t}(1 - 2t^2) \right\rangle,$

$\left\langle \frac{3}{8}(t + 4)^{-5/2}, 6(t + 1)^{-4}, -4te^{-t}(3 - 2t^2) \right\rangle$

59. $\left\langle \frac{t^5}{5} - \frac{3t^2}{2}, t^2 - t, 10t \right\rangle + C$

61. $\left\langle 2 \sin t, -\frac{2}{3} \cos 3t, \frac{1}{2} \sin 8t \right\rangle + C$

63. $\frac{1}{3}e^{3t}i + \tan^{-1}tj - \sqrt{2t}k + C$

65. $r(t) = \langle e^t + 1, 3 - \cos t, \tan t + 2 \rangle$

67. $r(t) = \langle t + 3, t^2 + 2, t^3 - 6 \rangle$

69. $r(t) = \left\langle \frac{1}{2}e^{2t} + \frac{1}{2}, 2e^{-t} + t - 1, t - 2e^t + 3 \right\rangle$

71. $\langle 2, 0, 2 \rangle$ 73. i 75. $\langle 0, 0, 0 \rangle$

77. $(e^2 + 1) \langle 1, 2, -1 \rangle$ 79. a. False b. True c. True

81. $\langle 2 - t, 3 - 2t, \pi/2 + t \rangle$ 83. $\langle 2 + 3t, 9 + 7t, 1 + 2t \rangle$

85. (1, 0) 87. (1, 0, 0) 89. $r(t) = \langle a_1t, a_2t, a_3t \rangle$ or

$r(t) = \langle a_1e^{kt}, a_2e^{kt}, a_3e^{kt} \rangle$, where a_i and k are real numbers

Section 14.3 Exercises, pp. 892–896

1. $\mathbf{v}(t) = \mathbf{r}'(t)$, speed $= |\mathbf{r}'(t)|$, $\mathbf{a}(t) = \mathbf{r}''(t)$ 3. $m\mathbf{a}(t) = \mathbf{F}$

5. $\mathbf{v}(t) = \int \mathbf{a}(t) dt = \langle v_1(t), v_2(t) \rangle + \mathbf{C}$. Use initial conditions to find $\mathbf{C}$. 7. a. $t = 3$ s b. $\mathbf{r}(t) = \langle 60t, -16t^2 + 96t + 3 \rangle$

9. a. $\langle 6t, 8t \rangle$, 10t b. $\langle 6, 8 \rangle$ 11. a. $\mathbf{v}(t) = \langle 2, -4 \rangle$, $|\mathbf{v}(t)| = 2\sqrt{5}$ b. $\mathbf{a}(t) = \langle 0, 0 \rangle$ 13. a. $\mathbf{v}(t) = \langle 8 \cos t, -8 \sin t \rangle$, $|\mathbf{v}(t)| = 8$ b. $\mathbf{a}(t) = \langle -8 \sin t, -8 \cos t \rangle$ 15. a. $\langle 2t, 2t, t \rangle$, 3t

b. $\langle 2, 2, 1 \rangle$ 17. a. $\mathbf{v}(t) = \langle 1, -4, 6 \rangle$, $|\mathbf{v}(t)| = \sqrt{53}$

b. $\mathbf{a}(t) = \langle 0, 0, 0 \rangle$ 19. a. $\mathbf{v}(t) = \langle 0, 2t, -e^{-t} \rangle$,

$|\mathbf{v}(t)| = \sqrt{4t^2 + e^{-2t}}$ b. $\mathbf{a}(t) = \langle 0, 2, e^{-t} \rangle$

21. a. $[c, d] = [0, 1]$ b. $\langle 1, 2t \rangle$, $\langle 2, 8t \rangle$

23. a. $[0, \frac{2\pi}{3}]$ b. $\mathbf{V}_r(t) = \langle -\sin t, 4 \cos t \rangle$, $\mathbf{V}_R(t) = \langle -3 \sin 3t, 12 \cos 3t \rangle$

25. a. $[1, e^{36}]$ b. $\mathbf{V}_r(t) = \langle 2t, -8t^3, 18t^5 \rangle$,

$\mathbf{V}_R(t) = \langle \frac{1}{t}, -\frac{4}{t} \ln t, \frac{9}{t} \ln^2 t \rangle$

27. a.

b. $\langle -20 \sin t - 50 \sin 5t, 20 \cos t + 50 \cos 5t \rangle$

c. $\mathbf{v}$ d. 70 ft/s; 30 ft/s

29. $\mathbf{r}(t)$ lies on a circle of radius 8;

$\langle -16 \sin 2t, 16 \cos 2t \rangle \cdot \langle 8 \cos 2t, 8 \sin 2t \rangle = 0$. 31. $\mathbf{r}(t)$ lies on a sphere of radius 2; $\langle \cos t - \sqrt{3} \sin t, \sqrt{3} \cos t + \sin t \rangle \cdot \langle \sin t + \sqrt{3} \cos t, \sqrt{3} \sin t - \cos t \rangle = 0$. 33. 5

35. $\mathbf{v}(t) = \langle 2, t + 3 \rangle$, $\mathbf{r}(t) = \langle 2t, \frac{t^2}{2} + 3t \rangle$

37. $\mathbf{v}(t) = \langle 0, 10t + 5 \rangle$, $\mathbf{r}(t) = \langle 1, 5t^2 + 5t - 1 \rangle$

39. $\mathbf{v}(t) = \langle \sin t, -2 \cos t + 3 \rangle$, $\mathbf{r}(t) = \langle -\cos t + 2, -2 \sin t + 3t \rangle$

41. a. $\mathbf{v}(t) = \langle 30, -9.8t + 6 \rangle$, $\mathbf{r}(t) = \langle 30t, -4.9t^2 + 6t \rangle$

b. c. $T \approx 1.22$ s, range ≈ 36.7 m
d. 1.84 m

43. a. $\mathbf{v}(t) = \langle 80, 10 - 32t \rangle$, $\mathbf{r}(t) = \langle 80t, -16t^2 + 10t + 6 \rangle$

b. c. 1 s, 80 ft
d. Max height ≈ 7.56 ft

45. a. $\mathbf{v}(t) = \langle 125, -32t + 125\sqrt{3} \rangle$, $\mathbf{r}(t) = \langle 125t, -16t^2 + 125\sqrt{3}t + 20 \rangle$

b. c. 13.6 s, 1702.5 ft d. 752.4 ft

47. $\mathbf{v}(t) = \langle 1, 5, 10t \rangle$, $\mathbf{r}(t) = \langle t, 5t + 5, 5t^2 \rangle$

49. $\mathbf{v}(t) = \langle -\cos t + 1, \sin t + 2, t \rangle$,

$\mathbf{r}(t) = \langle -\sin t + t, -\cos t + 2t + 1, \frac{t^2}{2} \rangle$

51. **a.** $\mathbf{v}(t) = \langle 200, 200, -9.8t \rangle$, $\mathbf{r}(t) = \langle 200t, 200t, -4.9t^2 + 1 \rangle$

b. **c.** 0.452 s, 127.8 m **d.** 1 m

53. **a.** $\mathbf{v}(t) = \langle 60 + 10t, 80, 80 - 32t \rangle$,
 $\mathbf{r}(t) = \langle 60t + 5t^2, 80t, 80t - 16t^2 + 3 \rangle$

b. **c.** 5.04 s, 589 ft
d. 103 ft

55. **a.** $\mathbf{v}(t) = \langle 300, 2.5t + 400, -9.8t + 500 \rangle$,
 $\mathbf{r}(t) = \langle 300t, 1.25t^2 + 400t, -4.9t^2 + 500t + 10 \rangle$

b. **c.** 102.1 s, 61,941.5 m
d. 12,765.1 m

57. **a.** False **b.** True **c.** False **d.** True **e.** False **f.** True
g. True **59.** 15.3 s, 1988.3 m, 287.0 m **61.** 21.7 s, 4330.1 ft, 1875 ft

63. Approx. 27.4° and 62.6°

65. **a.** $\mathbf{v}(t) = \langle -a \sin t, b \cos t \rangle$; $|\mathbf{v}(t)| = \sqrt{a^2 \sin^2 t + b^2 \cos^2 t}$

c. Yes **d.** Max $\left\{ \frac{a}{b}, \frac{b}{a} \right\}$ **67.** Approx. 23.5° or 59.6°

69. 113.4 ft/s **71. a.** 1.2 ft, 0.46 s **b.** 0.88 ft/s **c.** 0.85 ft

d. More curve in the second half **e.** $c = 28.17 \text{ ft/s}^2$

73. $T = \frac{|\mathbf{v}_0| \sin \alpha + \sqrt{|\mathbf{v}_0|^2 \sin^2 \alpha + 2gy_0}}{g}$,

range = $|\mathbf{v}_0| (\cos \alpha) T$, max height = $y_0 + \frac{|\mathbf{v}_0|^2 \sin^2 \alpha}{2g}$

75. **a.** $\left[0, \frac{2\pi}{\omega} \right]$ **b.** $\mathbf{v}(t) = \langle -A\omega \sin \omega t, A\omega \cos \omega t \rangle$ is not constant;
 $|\mathbf{v}(t)| = |A\omega|$ is constant. **c.** $\mathbf{a}(t) = \langle -A\omega^2 \cos \omega t, -A\omega^2 \sin \omega t \rangle$

d. $\mathbf{r}$ and $\mathbf{v}$ are orthogonal; $\mathbf{r}$ and $\mathbf{a}$ are in opposite directions.

e.

77. **a.** $\mathbf{r}(t) = \langle 5 \sin(\pi t/6), 5 \cos(\pi t/6) \rangle$

b. $\mathbf{r}(t) = \langle 5 \sin(\frac{1-e^{-t}}{5}), 5 \cos(\frac{1-e^{-t}}{5}) \rangle$

79. $\{(\cos t, \sin t, c \sin t) : t \in \mathbb{R}\}$ satisfies the equations $x^2 + y^2 = 1$ and $z - cy = 0$ so that $\langle \cos t, \sin t, c \sin t \rangle$ lies on the intersection of a right circular cylinder and a plane, which is an ellipse.

83. **a.** The direction of $\mathbf{r}$ does not change. **b.** Constant in direction, not in magnitude

Section 14.4 Exercises, pp. 900–902

1. $\sqrt{5}(b-a)$ 3. $\int_a^b |\mathbf{v}(t)| dt$ 5. 20π 7. If the parameter t used to describe a trajectory also measures the arc length s of the curve that is generated, we say the curve has been parameterized by its arc length.

9. 5 11. 3π 13. $\frac{\pi^2}{8}$ 15. $5\sqrt{34}$ 17. $4\pi\sqrt{65}$ 19. 9 21. $\frac{3}{2}$

27. Approx. 66,626 mi/hr 29. 19.38

31. 32.50 33. Yes 35. No; $\mathbf{r}(s) = \left\langle \frac{s}{\sqrt{5}}, \frac{2s}{\sqrt{5}} \right\rangle$, $0 \leq s \leq 3\sqrt{5}$

37. No; $\mathbf{r}(s) = \left\langle 2 \cos \frac{s}{2}, 2 \sin \frac{s}{2} \right\rangle$, $0 \leq s \leq 4\pi$

39. No; $\mathbf{r}(s) = \langle \cos s, \sin s \rangle$, $0 \leq s \leq \pi$

41. No; $\mathbf{r}(s) = \left\langle \frac{s}{\sqrt{3}} + 1, \frac{s}{\sqrt{3}} + 1, \frac{s}{\sqrt{3}} + 1 \right\rangle$, $s \geq 0$

43. **a.** True **b.** True **c.** True **d.** False 45. **a.** If $a^2 = b^2 + c^2$, then $|\mathbf{r}(t)|^2 = (a \cos t)^2 + (b \sin t)^2 + (c \sin t)^2 = a^2$ so that $\mathbf{r}(t)$ is a circle centered at the origin of radius $|a|$. **b.** $2\pi a$

c. If $a^2 + c^2 + e^2 = b^2 + d^2 + f^2$ and $ab + cd + ef = 0$, then $\mathbf{r}(t)$ is a circle of radius $\sqrt{a^2 + c^2 + e^2}$ and its arc length is

$2\pi\sqrt{a^2 + c^2 + e^2}$. 47. **a.** $\int_a^b \sqrt{(Ah'(t))^2 + (Bh'(t))^2} dt$

$= \int_a^b \sqrt{(A^2 + B^2)(h'(t))^2} dt = \sqrt{A^2 + B^2} \int_a^b |h'(t)| dt$

b. $64\sqrt{29}$ **c.** $\frac{7\sqrt{29}}{4}$ 49. **a.** 5.102 s

b. $\int_0^{5.102} \sqrt{400 + (25 - 9.8t)^2} dt$ **c.** 124.43 m **d.** 102.04 m

51. $|\mathbf{v}(t)| = \sqrt{a^2 + b^2 + c^2} = 1$, if $a^2 + b^2 + c^2 = 1$

53. $\int_a^b |\mathbf{r}'(t)| dt = \int_a^b \sqrt{(cf'(t))^2 + (cg'(t))^2} dt$

$= |c| \int_a^b \sqrt{(f'(t))^2 + (g'(t))^2} dt = |c|L$

Section 14.5 Exercises, pp. 913–915

1. 0 3. $\kappa = \frac{1}{|\mathbf{v}|} \left| \frac{d\mathbf{T}}{dt} \right|$ or $\kappa = \frac{|\mathbf{v} \times \mathbf{a}|}{|\mathbf{v}|^3}$ 5. $\mathbf{N} = \frac{d\mathbf{T}/dt}{|d\mathbf{T}/dt|}$

7. These three unit vectors are mutually orthogonal at all points of the curve. 9. The torsion measures the rate at which the curve rises or

twists out of the $\mathbf{TN}$ -plane at a point. 11. $\mathbf{T} = \frac{\langle 1, 2, 3 \rangle}{\sqrt{14}}$, $\kappa = 0$

13. $\mathbf{T} = \frac{\langle 1, 2 \cos t, -2 \sin t \rangle}{\sqrt{5}}$, $\kappa = \frac{1}{5}$

$$15. \mathbf{T} = \frac{\langle \sqrt{3} \cos t, \cos t, -2 \sin t \rangle}{2}, \kappa = \frac{1}{2}$$

$$17. \mathbf{T} = \frac{\langle 1, 4t \rangle}{\sqrt{1 + 16t^2}}, \kappa = \frac{4}{(1 + 16t^2)^{3/2}}$$

$$19. \mathbf{T} = \left\langle \cos\left(\frac{\pi t^2}{2}\right), \sin\left(\frac{\pi t^2}{2}\right) \right\rangle, \kappa = \pi t$$

$$21. \frac{1}{3} \quad 23. \frac{2}{(4t^2 + 1)^{3/2}} \quad 25. \frac{2\sqrt{5}}{(20 \sin^2 t + \cos^2 t)^{3/2}}$$

$$27. \mathbf{T} = \langle \cos t, -\sin t \rangle, \mathbf{N} = \langle -\sin t, -\cos t \rangle$$

$$29. \mathbf{T} = \frac{\langle t, -3, 0 \rangle}{\sqrt{t^2 + 9}}, \mathbf{N} = \frac{\langle 3, t, 0 \rangle}{\sqrt{t^2 + 9}}$$

$$31. \mathbf{T} = \langle -\sin t^2, \cos t^2 \rangle, \mathbf{N} = \langle -\cos t^2, -\sin t^2 \rangle$$

$$33. \mathbf{T} = \frac{\langle 2t, 1 \rangle}{\sqrt{4t^2 + 1}}, \mathbf{N} = \frac{\langle 1, -2t \rangle}{\sqrt{4t^2 + 1}} \quad 35. a_N = a_T = 0$$

$$37. a_T = \sqrt{3}e^t; a_N = \sqrt{2}e^t \quad 39. \mathbf{a} = \frac{6t}{\sqrt{9t^2 + 4}}\mathbf{N} + \frac{18t^2 + 4}{\sqrt{9t^2 + 4}}\mathbf{T}$$

$$41. \mathbf{B}(t) = \langle 0, 0, -1 \rangle, \tau = 0 \quad 43. \mathbf{B}(t) = \langle 0, 0, 1 \rangle, \tau = 0$$

$$45. \mathbf{B}(t) = \frac{\langle -\sin t, \cos t, 2 \rangle}{\sqrt{5}}, \tau = -\frac{1}{5}$$

$$47. \mathbf{B}(t) = \frac{\langle 5, 12 \sin t, -12 \cos t \rangle}{13}, \tau = \frac{12}{169} \quad 49. \mathbf{a. False}$$

b. False c. False d. True e. False f. False g. False

$$51. \kappa = \frac{2}{(1 + 4x^2)^{3/2}} \quad 53. \kappa = \frac{x}{(x^2 + 1)^{3/2}}$$

$$57. \kappa = \frac{|ab|}{(a^2 \cos^2 t + b^2 \sin^2 t)^{3/2}} \quad 59. \kappa = \frac{2|a|}{(1 + 4a^2 t^2)^{3/2}}$$

61. b. $\mathbf{v}_A(t) = \langle 1, 2, 3 \rangle$, $\mathbf{a}_A(t) = \langle 0, 0, 0 \rangle$ and $\mathbf{v}_B(t) = \langle 2t, 4t, 6t \rangle$, $\mathbf{a}_B(t) = \langle 2, 4, 6 \rangle$; A has constant velocity and zero acceleration, while B has increasing speed and constant acceleration.

c. $\mathbf{a}_A(t) = 0\mathbf{N} + 0\mathbf{T}$, $\mathbf{a}_B(t) = 0\mathbf{N} + 2\sqrt{14}\mathbf{T}$; both normal components are zero since the path is a straight line ($\kappa = 0$).

$$63. \mathbf{b.} \quad \mathbf{v}_A(t) = \langle -\sin t, \cos t \rangle, \mathbf{a}_A(t) = \langle -\cos t, -\sin t \rangle$$

$$\mathbf{v}_B(t) = \langle -2t \sin t^2, 2t \cos t^2 \rangle$$

$$\mathbf{a}_B(t) = \langle -4t^2 \cos t^2 - 2 \sin t^2, -4t^2 \sin t^2 + 2 \cos t^2 \rangle$$

c. $\mathbf{a}_A(t) = \mathbf{N} + 0\mathbf{T}$, $\mathbf{a}_B(t) = 4t^2\mathbf{N} + 2\mathbf{T}$; for A, the acceleration is always normal to the curve, but this is not true for B.

$$65. \mathbf{b.} \kappa = \frac{1}{2\sqrt{2(1 - \cos t)}} \quad \mathbf{c.}$$

d. Minimum curvature at $t = \pi$

$$67. \mathbf{b.} \kappa = \frac{1}{t(1 + t^2)^{3/2}} \quad \mathbf{c.}$$

d. No maximum or minimum curvature

$$69. \kappa = \frac{e^x}{(1 + e^{2x})^{3/2}}, \left(-\frac{\ln 2}{2}, \frac{1}{\sqrt{2}} \right), \frac{2\sqrt{3}}{9}$$

$$71. \frac{1}{\kappa} = \frac{1}{2}; x^2 + \left(y - \frac{1}{2} \right)^2 = \frac{1}{4}$$

$$73. \frac{1}{\kappa} = 4; (x - \pi)^2 + (y + 2)^2 = 16$$

$$75. \kappa\left(\frac{\pi}{2n}\right) = n^2; \kappa \text{ increases as } n \text{ increases.}$$

$$77. \mathbf{a.} \text{ Speed} = \sqrt{V_0^2 - 2V_0 g t \sin \alpha + g^2 t^2}$$

$$\mathbf{b.} \kappa(t) = \frac{g V_0 \cos \alpha}{(V_0^2 - 2V_0 g t \sin \alpha + g^2 t^2)^{3/2}}$$

c. Speed has a minimum at $t = \frac{V_0 \sin \alpha}{g}$ and $\kappa(t)$ has a maximum at

$$t = \frac{V_0 \sin \alpha}{g}. \quad 79. \kappa = \frac{1}{|\mathbf{v}|} \cdot \left| \frac{d\mathbf{T}}{dt} \right|, \text{ where } \mathbf{T} = \frac{\langle b, d, f \rangle}{\sqrt{b^2 + d^2 + f^2}}$$

and b, d, and f are constant. Therefore, $\frac{d\mathbf{T}}{dt} = \mathbf{0}$ so $\kappa = 0$.

$$81. \mathbf{a.} \kappa_1(x) = \frac{2}{(1 + 4x^2)^{3/2}}$$

$$\kappa_2(x) = \frac{12x^2}{(1 + 16x^6)^{3/2}}$$

$$\kappa_3(x) = \frac{30x^4}{(1 + 36x^{10})^{3/2}}$$

c. κ_1 has its maximum at $x = 0$, κ_2 has its maxima at $x = \pm \sqrt[6]{\frac{1}{56}}$, and κ_3 has its maxima at $x = \pm \sqrt[10]{\frac{1}{99}}$. d. $\lim_{n \rightarrow \infty} z_n = 1$; the graphs of $y = f_n(x)$ show that as $n \rightarrow \infty$, the point corresponding to maximum curvature gets arbitrarily close to the point $(1, 0)$.

f. See graph in part (c).

g. Check that $\mathbf{T}$, $\mathbf{N}$, and $\mathbf{B}$ have unit length and are mutually orthogonal.

$$\mathbf{h. \tau} = -\frac{4}{25}$$

63. a. Consider first the case where $a_3 = b_3 = c_3 = 0$, and show that for all $s \neq t$ in I , $\mathbf{r}(t) \times \mathbf{r}(s)$ is a multiple of the constant vector $\langle b_1c_2 - b_2c_1, a_2c_1 - a_1c_2, a_1b_2 - a_2b_1 \rangle$, which implies $\mathbf{r}(t) \times \mathbf{r}(s)$ is always orthogonal to the same vector, and therefore the vectors $\mathbf{r}(t)$ must all lie in the same plane. When a_3 , b_3 , and c_3 are not necessarily 0, the curve still lies in a plane because these constants represent a simple translation of the curve to a different location in $\mathbb{R}^3$.

b. Because the curve lies in a plane, $\mathbf{B}$ is always normal to the plane and has length 1. Therefore, $\frac{d\mathbf{B}}{ds} = \mathbf{0}$ and $\tau = 0$.

79. a.

b. $\mathbf{v} = \pm \langle 1, 1 \rangle$

c. $\mathbf{v} = \pm \langle 1, -1 \rangle$

83. $\langle \mathbf{u}, \mathbf{v} \rangle = \langle \pi \cos \pi x \sin 2\pi y, 2\pi \sin \pi x \cos 2\pi y \rangle$

87. $\nabla f(x, y) = \frac{1}{(x^2 + y^2)^2} \langle y^2 - x^2 - 2xy, x^2 - y^2 - 2xy \rangle$

89. $\nabla f(x, y, z) = -\frac{1}{\sqrt{25 - x^2 - y^2 - z^2}} \langle x, y, z \rangle$

91. $\nabla f(x, y, z) = \frac{(y + xz) \langle 1, z, y \rangle - (x + yz) \langle z, 1, x \rangle}{(y + xz)^2}$
 $= \frac{1}{(y + xz)^2} \langle y(1 - z^2), x(z^2 - 1), y^2 - x^2 \rangle$

Section 15.6 Exercises, pp. 980–983

1. The gradient of f is a multiple of $\mathbf{n}$.

3. $F_x(a, b, c)(x - a) + F_y(a, b, c)(y - b) + F_z(a, b, c)(z - c) = 0$

5. Multiply the change in x by $f_x(a, b)$ and the change in y by $f_y(a, b)$, and add both terms to f . 7. $dz = f_x(x, y) dx + f_y(x, y) dy$

9. $z = 5x - 3y + 5$ 11. $3x - y + 6z = 4$ 13. $2x + y + z = 4$;
 $4x + y + z = 7$ 15. $x + y + z = 6$; $3x + 4y + z = 12$

17. $z = -8x - 4y + 16$ and $z = 4x + 2y + 7$ 19. $z = y + 1$

and $z = x + 1$ 21. $x + \frac{1}{2}y + \sqrt{3}z = 2 + \frac{\sqrt{3}\pi}{6}$ and

$\frac{1}{2}x + y + \sqrt{3}z = \frac{5\sqrt{3}\pi}{6} - 2$ 23. $\frac{1}{2}x + \frac{2}{3}y + 2\sqrt{3}z = -2$ and

$x - 2y + 2\sqrt{14}z = 2$ 25. $z = 8x - 4y - 4$ and $z = -x - y - 1$

27. $z = \frac{7}{25}x - \frac{1}{25}y - \frac{2}{5}$ and $z = -\frac{7}{25}x + \frac{1}{25}y + \frac{6}{5}$

29. $z = \frac{1}{2}x + \frac{1}{2}y + \frac{\pi}{4} - 1$

31. $\frac{1}{6}(x - \pi) + \frac{\pi}{6}(y - 1) + \pi\left(z - \frac{1}{6}\right) = 0$

33. a. $L(x, y) = 4x + y - 6$ b. $L(2.1, 2.99) = 5.39$

35. a. $L(x, y) = -6x - 4y + 7$ b. $L(3.1, -1.04) = -7.44$

37. a. $L(x, y, z) = x + y + 2z$ b. $L(0.1, -0.2, 0.2) = 0.3$

39. $dz = -6dx - 5dy = -0.1$ 41. $dz = dx + dy = 0.05$

43. a. The surface area decreases. b. Impossible to say

c. $\Delta S \approx 53.3$ d. $\Delta S \approx 33.95$ e. $R dR = r dr$ 45. $\frac{\Delta A}{A} \approx 3.5\%$

47. $dw = (y^2 + 2xz) dx + (2xy + z^2) dy + (x^2 + 2yz) dz$

49. $dw = \frac{dx}{y + z} - \frac{u + x}{(y + z)^2} dy - \frac{u + x}{(y + z)^2} dz + \frac{du}{y + z}$

51. a. $\Delta c \approx 0.035$ b. When $\theta = \frac{\pi}{20}$ 53. a. True b. True

c. False 55. $(1, -1, 1)$ and $(1, -1, -1)$

57. Points with $x = 0, \pm \frac{\pi}{2}, \pm \pi$ and $y = \pm \frac{\pi}{2}$, or points with

$x = \pm \frac{\pi}{4}, \pm \frac{3\pi}{4}$ and $y = 0, \pm \pi$

59. a. $\Delta S \approx 0.749$ b. More sensitive to changes in r

61. a. $\Delta A \approx \frac{2}{1225} = 0.00163$ b. No. The batting average increases

more if the batter gets a hit than it decreases if he fails to get a hit.

c. Yes. The answer depends on whether A is less than 0.500 or greater than 0.500. 63. a. $\Delta V \approx \frac{21}{5000} = 0.0042$ b. $\frac{\Delta V}{V} \approx -4\%$ c. $2p$

65. a. $f_r = n(1 - r)^{n-1}$, $f_n = -(1 - r)^n \ln(1 - r)$

b. $\Delta P \approx 0.027$ c. $\Delta P \approx 2 \times 10^{-20}$ 67. $\Delta R \approx 7/540 \approx 0.013\Omega$

69. a. Apply the Chain Rule. b. Follows directly from (a)

c. $d(\ln(xy)) = \frac{dx}{x} + \frac{dy}{y}$ d. $d(\ln(x/y)) = \frac{dx}{x} - \frac{dy}{y}$

e. $\frac{df}{f} = \frac{dx_1}{x_1} + \frac{dx_2}{x_2} + \cdots + \frac{dx_n}{x_n}$

Section 15.7 Exercises, pp. 993–996

1. The local maximum occurs at the highest point on the surface; you cannot get to a higher point in any direction. 3. The partial derivatives are both zero or do not exist.

5. The discriminant is a determinant; it is defined as $D(a, b) = f_{xx}(a, b)f_{yy}(a, b) - f_{xy}^2(a, b)$.7. f has an absolute minimum value on R at (a, b) if $f(a, b) \leq f(x, y)$ for all (x, y) in R . 9. Saddle point 11. Local min 13. $(0, 0)$

15. $(0, 1)$, $(0, -1)$ 17. $(0, 0)$, $(2, 2)$, and $(-2, -2)$

19. $(0, 2)$, $(\pm 1, 2)$ 21. $(3, 0)$, $(-15, 6)$ 23. Saddle point at $(0, 0)$

25. Local min at $(0, 0)$ 27. Saddle point at $(0, 0)$; local min at $(1, 1)$ and $(-1, -1)$ 29. $(0, 0)$; Second Derivative Test is inconclusive; absolute min of 4 at $(0, 0)$ 31. Local min at $(2, 0)$

33. Saddle point at $(0, 0)$; local max at $\left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right)$ and $\left(-\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}\right)$; local min at $\left(\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}\right)$ and $\left(-\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right)$

35. Local min at $(-1, 0)$; local max at $(1, 0)$ 37. Saddle point at $(0, 1)$; local min at $(\pm 2, 0)$ 39. Saddle point at $(0, 0)$ 41. Saddle point 43. Height = 32 in, base is 16 in $\times$ 16 in; volume is 8192 in³

45. 2 m $\times$ 2 m $\times$ 1 m 47. Absolute min: 0 = $f(0, 1)$; absolute max: 9 = $f(0, -2)$ 49. Absolute min: 4 = $f(0, 0)$; absolute max: 7 = $f(\pm 1, \pm 1)$ 51. Absolute min: 0 = $f(1, 0)$; absolute max: 3 = $f(1, 1) = f(1, -1)$ 53. Absolute min: 1 = $f(1, -2) = f(1, 0)$; absolute max: 4 = $f(1, -1)$

55. Absolute min: 0 = $f(0, 0)$; absolute max: $\frac{7}{8} = f\left(\frac{1}{\sqrt{2}}, \sqrt{2}\right)$

57. a. 1.83; 82.6° b. 14% 59. Absolute min: -4 = $f(0, 0)$; no absolute max on R 61. Absolute max: 2 = $f(0, 0)$; no absolute min on R 63. $P\left(\frac{4}{3}, \frac{2}{3}, \frac{4}{3}\right)$ 65. $(3, 4, 5)$, $(3, 4, -5)$

67. a. True b. False c. True d. True

69. Local min at $(0.3, -0.3)$; saddle point at $(0, 0)$

71. a.-d. $x = y = z = \frac{200}{3}$

73. a. $P\left(1, \frac{1}{3}\right)$ b. $P\left(\frac{1}{3}(x_1 + x_2 + x_3), \frac{1}{3}(y_1 + y_2 + y_3)\right)$

c. $P(\bar{x}, \bar{y})$, where $\bar{x} = \frac{1}{n} \sum_{k=1}^n x_k$ and $\bar{y} = \frac{1}{n} \sum_{k=1}^n y_k$

d. $d(x, y) = \sqrt{x^2 + y^2} + \sqrt{(x-2)^2 + y^2} + \sqrt{(x-1)^2 + (y-1)^2}$. Absolute max: $1 + \sqrt{3} = f\left(1, \frac{1}{\sqrt{3}}\right)$

77. $y = \frac{22}{13}x + \frac{46}{13}$ 79. $a = b = c = 3$

81. a. $\nabla d_1(x, y) = \frac{x-x_1}{d_1(x, y)}\mathbf{i} + \frac{y-y_1}{d_1(x, y)}\mathbf{j}$

b. $\nabla d_2(x, y) = \frac{x-x_2}{d_2(x, y)}\mathbf{i} + \frac{y-y_2}{d_2(x, y)}\mathbf{j}$

$\nabla d_3(x, y) = \frac{x-x_3}{d_3(x, y)}\mathbf{i} + \frac{y-y_3}{d_3(x, y)}\mathbf{j}$

c. Follows from $\nabla f = \nabla d_1 + \nabla d_2 + \nabla d_3$ d. Three unit vectors add to zero. e. P is the vertex at the large angle.

f. $P(0.255457, 0.304504)$ 83. a. Local max at $(1, 0)$, $(-1, 0)$

b. Local max at $(1, 0)$ and $(-1, 0)$ 85. $\frac{abc\sqrt{3}}{2}$

Section 15.8 Exercises, pp. 1002–1004

1. The level curve of f is tangent to the curve $g = 0$ at the optimal point; therefore, the gradients are parallel.

3. $1 = 2\lambda x$, $4 = 2\lambda y$, $x^2 + y^2 - 1 = 0$

5. Abs. min: 1; abs. max: 8 7. Abs. min: $-2\sqrt{5}$ at

$\left(-\frac{2}{\sqrt{5}}, -\frac{4}{\sqrt{5}}\right)$; abs. max: $2\sqrt{5}$ at $\left(\frac{2}{\sqrt{5}}, \frac{4}{\sqrt{5}}\right)$

9. Abs. min: -2 at $(-1, -1)$; abs. max: 2 at $(1, 1)$

11. Abs. min: -3 at $(-\sqrt{3}, \sqrt{3})$ and $(\sqrt{3}, -\sqrt{3})$; abs. max: 9 at $(3, 3)$ and $(-3, -3)$

13. Abs. min: e^{-9} at $(-3, 3)$ and $(3, -3)$; abs. max: e^3 at $(\sqrt{3}, \sqrt{3})$ and $(-\sqrt{3}, -\sqrt{3})$ 15. Abs. min: 9 at $(0, 3)$; abs. max: 34 at

$(-\sqrt{15}, -2)$ and $(\sqrt{15}, -2)$ 17. Abs. min: $-2\sqrt{11}$ at

$\left(-\frac{2}{\sqrt{11}}, -\frac{6}{\sqrt{11}}, \frac{2}{\sqrt{11}}\right)$; abs. max: $2\sqrt{11}$ at $\left(\frac{2}{\sqrt{11}}, \frac{6}{\sqrt{11}}, -\frac{2}{\sqrt{11}}\right)$

19. Abs. min: $-\frac{\sqrt{5}}{2}$ at $\left(-\frac{\sqrt{5}}{2}, 0, \frac{1}{2}\right)$; abs. max: $\frac{\sqrt{5}}{2}$ at $\left(\frac{\sqrt{5}}{2}, 0, \frac{1}{2}\right)$

21. Abs. min: -5 at $(-2, -2, -1)$; abs. max: 5 at $(2, 2, 1)$

23. Abs. min: -10 at $(-5, 0, 0)$; abs. max: $\frac{29}{2}$ at $\left(2, 0, \pm\sqrt{\frac{21}{2}}\right)$

25. Abs. min: $-\sqrt{3}$ at $\left(0, -\frac{1}{\sqrt{3}}, -\frac{2}{\sqrt{3}}\right)$; abs. max: $\frac{7}{4}$ at $\left(\frac{1}{2}, \frac{1}{2}, 1\right)$

and $\left(-\frac{1}{2}, \frac{1}{2}, 1\right)$ 27. 18 in $\times$ 18 in $\times$ 36 in 29. Abs. min: 0.6731;

abs. max: 1.1230 31. 2×1 33. $\left(-\frac{3}{17}, \frac{29}{17}, -3\right)$

35. Abs. min: $\sqrt{38 - 6\sqrt{29}}$ (or $\sqrt{29} - 3$); abs. max: $\sqrt{38 + 6\sqrt{29}}$ (or $\sqrt{29} + 3$) 37. $\ell = 3$ and $g = \frac{3}{2}$; $U = 15\sqrt{2}$

39. $\ell = \frac{16}{5}$ and $g = 1$; $U = 20.287$ 41. a. True b. False

43. $\frac{\sqrt{6}}{3}m \times \frac{\sqrt{6}}{3}m \times \frac{\sqrt{6}}{6}m$ 45. $2 \times 1 \times \frac{2}{3}$ 47. $P\left(\frac{4}{3}, \frac{2}{3}, \frac{4}{3}\right)$

49. Abs. min: 1; abs. max: 9 51. Abs. min: 0; abs. max: 3

53. $K = 7.5$ and $L = 5$ 57. Abs. max: 8 59. Abs. max:

$\sqrt{a_1^2 + a_2^2 + a_3^2 + \cdots + a_n^2}$ 61. a. Gradients are perpendicular to level surfaces. b. If the gradient were not in the plane spanned by ∇g and ∇h , f could be increased (decreased) by moving the point slightly. c. ∇f is a linear combination of ∇g and ∇h , since it belongs to the plane spanned by these two vectors. d. The gradient condition from part (c), as well as the constraints, must be satisfied.

63. Abs. min: $2 - 4\sqrt{2}$; abs. max: $2 + 4\sqrt{2}$

65. a. $y + 1 = \lambda y$, $x + 1 = \lambda x$, $xy = 4$ c. Abs. min of 108 over the curve C_1 d. Abs. max of 100 over the curve C_2

e. The constraint curve is unbounded, so there is no guarantee that an abs. min or max occurs over the curve $xy = 4$.

Chapter 15 Review Exercises, pp. 1005–1007

1. a. True b. False c. False d. False

3. $D = \{(x, y): x \geq y^2\}$

5. $D = \left\{(x, y): \frac{x^2}{4} + \frac{y^2}{9} \geq 1\right\}$

7. $D = \{(x, y): x^2 + y^2 \geq 1\}$; $R = (-\infty, 0]$; lower half of the hyperboloid of one sheet $x^2 + y^2 - z^2 = 1$

9.

11. 2 13. Does not exist

15. $\frac{2}{3}$ 17. 419. $\{(x, y) : y > x^2 + 1\}$ 21. $f_x = 6xy^5$; $f_y = 15x^2y^4$

$$23. f_x = \frac{2xy^2}{(x^2 + y^2)^2}; f_y = -\frac{2x^2y}{(x^2 + y^2)^2}$$

$$25. f_x = y(1 + xy)e^{xy}; f_y = x(1 + xy)e^{xy} \quad 27. f_{xx} = 4y^2e^{2xy}; f_{xy} = 2e^{2xy}(2xy + 1) = f_{yx}; f_{yy} = 4x^2e^{2xy}$$

$$29. \frac{\partial^2 u}{\partial x^2} = 6y = -\frac{\partial^2 u}{\partial y^2} \quad 31. \text{a. } V \text{ increases with } R \text{ if } r \text{ is fixed,}$$

$V_R > 0$; V decreases if r increases and R is fixed, $V_r < 0$.

b. $V_r = -4\pi r^2$; $V_R = 4\pi R^2$ c. The volume increases more if R is increased. 33. $4t + 2 \ln 5$

$$35. w_r = \frac{3r + s}{r(r + s)}; w_s = \frac{r + 3s}{s(r + s)}; w_t = \frac{1}{t}$$

$$37. \frac{dy}{dx} = -\frac{2xy}{2y^2 + (x^2 + y^2) \ln(x^2 + y^2)}$$

$$39. \text{a. } z'(t) = -24 \sin t \cos t = -12 \sin 2t$$

$$\text{b. } z'(t) > 0 \text{ for } \frac{\pi}{2} < t < \pi \text{ and } \frac{3\pi}{2} < t < 2\pi$$

41. a.

	$(a, b) = (0, 0)$	$(a, b) = (2, 0)$	$(a, b) = (1, 1)$
$\mathbf{u} = \left\langle \frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2} \right\rangle$	0	$4\sqrt{2}$	$-2\sqrt{2}$
$\mathbf{v} = \left\langle -\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2} \right\rangle$	0	$-4\sqrt{2}$	$-6\sqrt{2}$
$\mathbf{w} = \left\langle -\frac{\sqrt{2}}{2}, -\frac{\sqrt{2}}{2} \right\rangle$	0	$-4\sqrt{2}$	$2\sqrt{2}$

b. The function is increasing at $(2, 0)$ in the direction of $\mathbf{u}$ and decreasing at $(2, 0)$ in the directions of $\mathbf{v}$ and $\mathbf{w}$.

$$43. \nabla g = \langle 2xy^3, 3x^2y^2 \rangle; \nabla g(-1, 1) = \langle -2, 3 \rangle; D_{\mathbf{u}} g(-1, 1) = 2$$

 c. $\frac{1}{6} \left(1 - \frac{1}{a^2} \right)$ d. Yes e. $W = \frac{3^{1-p/2}}{2-p} (a^{2-p} - 1)$, for $p \neq 2$;
 otherwise, $W = \ln a$. f. $p > 2$ 81. ab

Section 17.3 Exercises, pp. 1121–1123

1. A simple curve has no self-intersections; the initial and terminal points of a closed curve are identical. 3. Test for equality of partial derivatives as given in Theorem 17.3. 5. Integrate f with respect to x and make the constant of integration a function of y to obtain $\varphi = \int f dx + h(y)$; finally, set $\frac{\partial \varphi}{\partial y} = g$ to determine h . 7. 0
9. Conservative 11. Not conservative 13. Conservative
15. Conservative 17. $\varphi(x, y) = \frac{1}{2}(x^2 + y^2)$ 19. Not conservative
21. $\varphi(x, y) = \sqrt{x^2 + y^2}$ 23. $\varphi(x, y, z) = xz + y$
25. Not conservative 27. $\varphi(x, y, z) = xy + yz + zx$
29. $\varphi(x, y) = \sqrt{x^2 + y^2 + z^2}$ 31. a. b. 0 33. a. b. 2 35. 3
37. -10 39. 24 41. $-\frac{1}{2}$ 43. $-\pi^2$ 45. 0 47. 0 49. 0
51. -5 53. 0 55. 1 57. a. False b. True c. True d. True
- e. True 59. 10 61. 25 63. a. Negative b. Positive c. No
67. a. Compare partial derivatives.

b. $\varphi(x, y, z) = \frac{GMm}{\sqrt{x^2 + y^2 + z^2}} = \frac{GMm}{|\mathbf{r}|}$

c. $\varphi(B) - \varphi(A) = GMm \left(\frac{1}{r_2} - \frac{1}{r_1} \right)$ d. No

69. a. $\frac{\partial}{\partial y} \left(\frac{-y}{(x^2 + y^2)^{p/2}} \right) = \frac{-x^2 + (p-1)y^2}{(x^2 + y^2)^{1+p/2}}$ and

$\frac{\partial}{\partial x} \left(\frac{x}{(x^2 + y^2)^{p/2}} \right) = \frac{(1-p)x^2 + y^2}{(x^2 + y^2)^{1+p/2}}$

b. The two partial derivatives in (a) are equal if $p = 2$.

c. $\varphi(x, y) = \tan^{-1}(y/x)$ 73. $\varphi(x, y) = \frac{1}{2}(x^2 + y^2)$

75. $\varphi(x, y) = \frac{1}{2}(x^4 + x^2y^2 + y^4)$

Section 17.4 Exercises, pp. 1133–1136

1. In both forms, the integral of a derivative is computed from boundary data. 3. Area $= \frac{1}{2} \oint_C x dy - y dx$, where C encloses the region 5. The integral in the flux form of Green's Theorem vanishes. 7. $\mathbf{F} = \langle y, x \rangle$

9. a. 0 b. 2 c. Yes d. No 11. a. -4 b. 0 c. No d. Yes
13. a. y^2 b. $12x^2y + 2xy$ c. No d. No 15. a. 1; no
- b. $\mathbf{r}_1(t) = \langle t, t^2 \rangle$, for $0 \leq t \leq 1$, and $\mathbf{r}_2(t) = \langle 1-t, 1-t \rangle$, for $0 \leq t \leq 1$ (answers may vary) c. Both integrals equal $\frac{1}{6}$. d. 0

17. a. -4 b. Both integrals equal -8. 19. a. $4x$ b. $\frac{16}{3}$

21. 25π 23. 16π 25. 32 27. a. 2 b. Both integrals equal 8π .

29. a. $2y$ b. $\frac{16}{15}$ 31. 104 33. $\frac{31 - 3e^4}{6}$ 35. 6 37. $\frac{8}{3}$

39. $8 - \frac{\pi}{2}$ 41. a. 0 b. 3π 43. a. 0 b. $-\frac{15\pi}{2}$ 45. a. 0

b. 2π 47. a. $\frac{16}{3}$ b. 0 49. a. True b. False c. True

51. Note: $\frac{\partial f}{\partial y} = 0 = \frac{\partial g}{\partial x}$ 53. The integral becomes $\iint_R 2 dA$.

55. a. $f_x = g_y = 0$ b. $\psi(x, y) = -2x + 4y$

57. a. $f_x = e^{-x} \sin y = -g_y$ b. $\psi(x, y) = e^{-x} \cos y$

59. a. Hint: $f_x = e^x \cos y$, $f_y = -e^x \sin y$,

$g_x = -e^x \sin y$, $g_y = -e^x \cos y$

b. $\varphi(x, y) = e^x \cos y$, $\psi(x, y) = e^x \sin y$

61. a. Hint: $f_x = -\frac{y}{x^2 + y^2}$, $f_y = \frac{x}{x^2 + y^2}$,

$g_x = \frac{x}{x^2 + y^2}$, $g_y = \frac{y}{x^2 + y^2}$

b. $\varphi(x, y) = x \tan^{-1} \frac{y}{x} + \frac{y}{2} \ln(x^2 + y^2) - y$,

$\psi(x, y) = y \tan^{-1} \frac{y}{x} - \frac{x}{2} \ln(x^2 + y^2) + x$

63. a.

$\mathbf{F} = \langle -4 \cos x \sin y, 4 \sin x \cos y \rangle$ b. Yes, the divergence equals zero.

c. No, the two-dimensional curl equals $8 \cos x \cos y$. d. 0 e. 32

67. c. The vector field is undefined at the origin.

69.

Basic ideas: Let C_1 and C_2 be two smooth simple curves from A to B .

$\int_{C_1} \mathbf{F} \cdot \mathbf{n} ds - \int_{C_2} \mathbf{F} \cdot \mathbf{n} ds = \oint_C \mathbf{F} \cdot \mathbf{n} ds = \iint_R (f_x + g_y) dA = 0$

and $\int_{C_1} \mathbf{F} \cdot \mathbf{n} ds = \int_{C_1} \psi_x dx + \psi_y dy = \int_{C_1} d\psi = \psi(B) - \psi(A)$

71. Use $\nabla \varphi \cdot \nabla \psi = \langle f, g \rangle \cdot \langle -g, f \rangle = 0$.

Section 17.5 Exercises, pp. 1143–1146

1. Compute $f_x + g_y + h_z$. 3. There is no source or sink.

5. It indicates the axis and the angular speed of the circulation at a point. 7. 0 9. 3 11. 0 13. $2(x + y + z)$

15. $\frac{x^2 + y^2 + 3}{(1 + x^2 + y^2)^2}$ 17. $\frac{1}{|\mathbf{r}|^2}$ 19. $-\frac{1}{|\mathbf{r}|^4}$ 21. a. Positive for

both points b. $\text{div } \mathbf{F} = 2$ c. Outward everywhere d. Positive

23. a. $\text{curl } \mathbf{F} = 2\mathbf{i}$ b. $|\text{curl } \mathbf{F}| = 2$

25. a. $\text{curl } \mathbf{F} = 2\mathbf{i} - 2\mathbf{j} + 2\mathbf{k}$ b. $|\text{curl } \mathbf{F}| = 2\sqrt{3}$ 27. $3y\mathbf{k}$

29. $-4z\mathbf{j}$ 31. 0 33. 0 35. Follows from partial differentiation of

$\frac{1}{(x^2 + y^2 + z^2)^{3/2}}$ 37. Combine Exercise 36 with Theorem 17.10.

39. a. False b. False c. False d. False e. False 41. a. No
b. No c. Yes, scalar function d. No e. No f. No g. Yes,
vector field h. No i. Yes, vector field 43. a. At $(0, 1, 1)$,
 $\mathbf{F}$ points in the positive x -direction; at $(1, 1, 0)$, $\mathbf{F}$ points in the nega-
tive z -direction; at $(0, 1, -1)$, $\mathbf{F}$ points in the negative x -direction;
and at $(-1, 1, 0)$, $\mathbf{F}$ points in the positive z -direction. These vectors
circle the y -axis in the counterclockwise direction looking along $\mathbf{a}$
from head to tail. b. The argument in part (a) can be repeated in
any plane perpendicular to the y -axis to show that the vectors of $\mathbf{F}$
circle the y -axis in the counterclockwise direction looking along $\mathbf{a}$
from head to tail. Alternatively, computing the cross product, we
find that $\mathbf{F} = \mathbf{a} \times \mathbf{r} = \langle z, 0, -x \rangle$, which is a rotation field in any
plane perpendicular to $\mathbf{a}$. 45. Compute an explicit expression for
 $\mathbf{a} \times \mathbf{r}$ and then take the required partial derivatives. 47. $\text{div } \mathbf{F}$ has
a maximum value of 6 at $(1, 1, 1)$, $(1, -1, -1)$, $(-1, 1, 1)$, and
 $(-1, -1, -1)$. 49. $\mathbf{n} = \langle a, b, 2a + b \rangle$, where a and b are real
numbers 51. $\mathbf{F} = \frac{1}{2}(y^2 + z^2)\mathbf{i}$; no 53. a. The wheel does not spin.
b. Clockwise, looking in the positive y -direction c. The wheel does
not spin. 55. $\omega = \frac{10}{\sqrt{3}}$, or $\frac{5}{\sqrt{3}\pi} \approx 0.9189$ revolution per unit time
57. $\mathbf{F} = -200ke^{-x^2+y^2+z^2}(-x\mathbf{i} + y\mathbf{j} + z\mathbf{k})$
 $\nabla \cdot \mathbf{F} = -200k(1 + 2(x^2 + y^2 + z^2))e^{-x^2+y^2+z^2}$

59. a. $\mathbf{F} = -\frac{GMm\mathbf{r}}{|\mathbf{r}|^3}$ b. See Theorem 17.11.

$$\begin{aligned} 61. \quad \rho \left(\frac{\partial u}{\partial t} + u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} + w \frac{\partial u}{\partial z} \right) &= -\frac{\partial p}{\partial x} + \mu \left(\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} \right) \\ \rho \left(\frac{\partial v}{\partial t} + u \frac{\partial v}{\partial x} + v \frac{\partial v}{\partial y} + w \frac{\partial v}{\partial z} \right) &= -\frac{\partial p}{\partial y} + \mu \left(\frac{\partial^2 v}{\partial x^2} + \frac{\partial^2 v}{\partial y^2} + \frac{\partial^2 v}{\partial z^2} \right) \\ \rho \left(\frac{\partial w}{\partial t} + u \frac{\partial w}{\partial x} + v \frac{\partial w}{\partial y} + w \frac{\partial w}{\partial z} \right) &= -\frac{\partial p}{\partial z} + \mu \left(\frac{\partial^2 w}{\partial x^2} + \frac{\partial^2 w}{\partial y^2} + \frac{\partial^2 w}{\partial z^2} \right) \end{aligned}$$

63. a. Use $\nabla \times \mathbf{B} = -Ak \cos(kz - \omega t)\mathbf{i}$ and

$$\frac{\partial \mathbf{E}}{\partial t} = -A\omega \cos(kz - \omega t)\mathbf{i}. \quad \mathbf{b.}$$

Section 17.6 Exercises, pp. 1159–1161

1. $\mathbf{r}(u, v) = \langle a \cos u, a \sin u, v \rangle$, $0 \leq u \leq 2\pi$, $0 \leq v \leq h$
3. $\mathbf{r}(u, v) = \langle a \sin u \cos v, a \sin u \sin v, a \cos u \rangle$, $0 \leq u \leq \pi$,
 $0 \leq v \leq 2\pi$ 5. Use the parameterization from Exercise 3 and
compute $\int_0^\pi \int_0^{2\pi} f(a \sin u \cos v, a \sin u \sin v, a \cos u) a^2 \sin u \, dv \, du$.
7. The normal vectors point outward. 9. $\langle u, v, \frac{1}{3}(16 - 2u + 4v) \rangle$,
 $|u| < \infty$, $|v| < \infty$ 11. $\langle v \cos u, v \sin u, v \rangle$, $0 \leq u \leq 2\pi$,
 $2 \leq v \leq 8$ 13. $\langle 3 \cos u, 3 \sin u, v \rangle$, $0 \leq u \leq \frac{\pi}{2}$, $0 \leq v \leq 3$
15. The plane $z = 2x + 3y - 1$ 17. Part of the upper half of the
cone $z^2 = 16x^2 + 16y^2$ of height 12 and radius 3 (with $y \geq 0$)

19. 28π 21. $16\sqrt{3}$ 23. $\pi r \sqrt{r^2 + h^2}$ 25. 1728π 27. 0
29. 12 31. $4\pi\sqrt{5}$ 33. $\frac{(65\sqrt{65} - 1)\pi}{24}$ 35. $\frac{2\sqrt{3}}{3}$ 37. $\frac{1250\pi}{3}$
39. $e - 1$ 41. $\frac{1}{4\pi}$ 43. -8 45. 0 47. 4π 49. a. True
b. False c. True d. True 51. $8\pi(4\sqrt{17} + \ln(\sqrt{17} + 4))$
53. $8\pi a$ 55. 8 57. a. 0 b. 0; the flow is tangent to the surface
(radial flow). 59. $2\pi ah$ 61. $-400\left(e - \frac{1}{e}\right)^2$ 63. $8\pi a$
65. a. $4\pi(b^3 - a^3)$ b. The net flux is zero. 67. $(0, 0, \frac{2}{3}h)$
69. $(0, 0, \frac{7}{6})$ 73. Flux = $\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = \iint_R dA$

Section 17.7 Exercises, pp. 1169–1171

1. The integral measures the circulation along the closed curve C .
3. Under certain conditions, the accumulated rotation of the vector
field over the surface S equals the net circulation on the boundary of S .
5. Both integrals equal -2π . 7. Both integrals equal zero. 9. Both
integrals equal -18π . 11. -24π 13. $-\frac{128}{3}$ 15. 15π 17. 0
19. 0 21. -2π 23. -4π 25. $\nabla \times \mathbf{v} = \langle 1, 0, 0 \rangle$; a paddle
wheel with its axis aligned with the x -axis will spin with maximum angu-
lar speed counterclockwise (looking in the negative x -direction) at all
points. 27. $\nabla \times \mathbf{v} = \langle 0, -2, 0 \rangle$; a paddle wheel with its axis aligned
with the y -axis will spin with maximum angular speed clockwise (look-
ing in the negative y -direction) at all points. 29. a. False b. False
c. True d. True 31. 0 33. 0 35. 2π 37. $\pi(\cos \varphi - \sin \varphi)$;
maximum for $\varphi = 0$ 39. The circulation is 48π ; it depends on the
radius of the circle but not on the center. 41. a. The normal vectors
point toward the z -axis on the curved surface of S and in the direction of
 $\langle 0, 1, 0 \rangle$ on the flat surface of S . b. 2π c. 2π 43. The integral
is π for all a . 45. a. 0 b. 0 47. b. 2π for any circle of radius r
centered at the origin c. $\mathbf{F}$ is not differentiable along the z -axis.
49. Apply the Chain Rule. 51. $\int_C \mathbf{F} \cdot d\mathbf{r} = \iint_R \left(\frac{\partial h}{\partial y} - \frac{\partial g}{\partial z} \right) dA$

Section 17.8 Exercises, pp. 1179–1182

1. The surface integral measures the flow across the boundary.
3. The flux across the boundary equals the cumulative expansion or
contraction of the vector field inside the region. 5. 32π
7. The outward fluxes are equal. 9. Both integrals equal 96π .
11. Both integrals equal zero. 13. 0 15. 0 17. $16\sqrt{6}\pi$ 19. $\frac{2}{3}$
21. $-\frac{128}{3}\pi$ 23. 24π 25. -224π 27. 12π 29. 20
31. a. False b. False c. True 33. 0 35. $\frac{3}{2}$ 37. b. The net flux
between the two spheres is $4\pi(a^2 - \epsilon^2)$. 39. b. Use $\nabla \cdot \mathbf{E} = 0$.
c. The flux across S is the sum of the contributions from the
individual charges. d. For an arbitrary volume, we find
 $\frac{1}{\epsilon_0} \iiint_D q(x, y, z) \, dV = \iint_S \mathbf{E} \cdot \mathbf{n} \, dS = \iiint_D \nabla \cdot \mathbf{E} \, dV$.
e. Use $\nabla^2 \varphi = \nabla \cdot \nabla \varphi$. 41. 0 43. $e^{-1} - 1$ 45. $800\pi a^3 e^{-a^2}$

Chapter 17 Review Exercises, pp. 1182–1184

1. a. False b. True c. False d. False e. True

3. $\nabla\varphi = \langle 2x, 8y \rangle$ 5. $-\frac{\mathbf{r}}{|\mathbf{r}|^3}$ 7. $\mathbf{n} = \frac{1}{2} \langle x, y \rangle$ 9. $\frac{7}{8}(e^{48} - 1)$ 11. Both integralsequal zero. 13. 0 15. The circulation is -4π ; the outward flux is zero. 17. The circulation is zero; the outward flux is 2π .19. $\frac{4v_0 L^3}{3}$ 21. $\varphi(x, y, z) = xy + yz^2$ 23. $\varphi(x, y, z) = xye^z$ 25. 0 for both methods 27. a. $-\pi$ b. $\mathbf{F}$ is not conservative.29. 0 31. $\frac{20}{3}$ 33. 8π 35. The circulation is zero; the outward flux equals 2π . 37. a. $b = c$ b. $a = -d$ c. $a = -d$ and $b = c$ 39. $\nabla \cdot \mathbf{F} = 4\sqrt{x^2 + y^2 + z^2} = 4|\mathbf{r}|$, $\nabla \times \mathbf{F} = \mathbf{0}$, $\nabla \cdot \mathbf{F} \neq 0$; irrotational but not source free 41. $\nabla \cdot \mathbf{F} = 2y + 12xz^2$, $\nabla \times \mathbf{F} = \mathbf{0}$, $\nabla \cdot \mathbf{F} \neq 0$; irrotational but not source free43. a. -1 b. 0 c. $\mathbf{n} = \frac{1}{\sqrt{3}} \langle -1, 1, 1 \rangle$ 45. 18π 47. $4\sqrt{3}$ 49. $\frac{8\sqrt{3}}{3}$ 51. 8π 53. $4\pi a^2$ 55. a. Use $x = y = 0$ to confirm the highest point; use $z = 0$ to confirm the base. b. The hemisphere S has the greater surface area— $2\pi a^2$ for S versus $\frac{5\sqrt{5} - 1}{6} \pi a^2$ for T .57. 0 59. 99π 61. 0 63. $\frac{972}{5} \pi$ 65. $\frac{124}{5} \pi$ 67. $\frac{32}{3}$

CHAPTER D2

Section D2.1, pp. D2-10–D2-13

1. The order of a differential equation is the order of the highest order derivative in the equation. 3. A differential equation of the form $y''(t) + p(t)y'(t) + q(t)y(t) = f(t)$ is homogeneous if $f(t) = 0$ on the interval of interest. 5. If one function is a nonzero constant multiple of the other on the interval, then the two functions are linearly dependent. 7. Find two linearly independent solutions, y_1 and y_2 , of the corresponding homogeneous differential equation. Find any particular solution, y_p , of the original differential equation. The general solution is then $y = c_1y_1 + c_2y_2 + y_p$, where c_1 and c_2 are arbitrary constants.

9. order 2; linear; nonhomogeneous 11. order 2; nonlinear; nonhomogeneous

13. $y'' - 4y = (3e^{2t} - 5e^{-2t})'' - 4(3e^{2t} - 5e^{-2t})$
 $= 12e^{2t} - 20e^{-2t} - 12e^{2t} + 20e^{-2t}$
 $= 0$

15. $y'' - 9y = (4e^{3t} + 3e^{-3t} - 2t)'' - 9(4e^{3t} + 3e^{-3t} - 2t)$
 $= 36e^{3t} + 27e^{-3t} - 36e^{3t} - 27e^{-3t} + 18t$
 $= 18t$

17. $y'' - y' - 2y = (c_1e^{-t} + c_2e^{2t})'' - (c_1e^{-t} + c_2e^{2t})'$
 $= 2(c_1e^{-t} + c_2e^{2t})$
 $= c_1e^{-t} + 4c_2e^{2t} - (-c_1e^{-t} + 2c_2e^{2t})$
 $= 2c_1e^{-t} - 2c_2e^{2t}$
 $= 0$

19. $y'' + 6y' + 25y$
 $= (c_1e^{-3t} \sin 4t + c_2e^{-3t} \cos 4t)''$
 $+ 6(c_1e^{-3t} \sin 4t + c_2e^{-3t} \cos 4t)'$
 $+ 25(c_1e^{-3t} \sin 4t + c_2e^{-3t} \cos 4t)$
 $= (-7c_1e^{-3t} \sin 4t - 24c_1e^{-3t} \cos 4t + 24c_2e^{-3t} \sin 4t - 7c_2e^{-3t} \cos 4t)$
 $+ 6(-3c_1e^{-3t} \sin 4t + 4c_1e^{-3t} \cos 4t - 4c_2e^{-3t} \sin 4t - 3c_2e^{-3t} \cos 4t) + 25(c_1e^{-3t} \sin 4t + c_2e^{-3t} \cos 4t)$
 $= (-7 - 18 + 25)c_1e^{-3t} \sin 4t + (-24 + 24)c_1e^{-3t} \cos 4t$
 $+ (24 - 24)c_2e^{-3t} \sin 4t + (-7 - 18 + 25)c_2e^{-3t} \cos 4t$
 $= 0$

21. $ty'' - (t+1)y' + y = t[c_1e^t + c_2(t+1)]'' - (t+1) \cdot [c_1e^t + c_2(t+1)]' + [c_1e^t + c_2(t+1)]$
 $= t(c_1e^t)' - (t+1)(c_1e^t + c_2) + [c_1e^t + c_2(t+1)]$
 $= tc_1e^t - tc_1e^t - c_1e^t - (t+1)c_2 + c_1e^t + c_2(t+1)$
 $= 0$

23. $y = c_1e^{-6t} + c_2e^{6t}$

25. $y = c_1e^{-t} + c_2te^{-t}$

27. $y'' - y = (e^{-3t})'' - e^{-3t} = 9e^{-3t} - e^{-3t} = 8e^{-3t}$

29. $y'' - 4y' + 4y = (t^2e^{2t})'' - 4(t^2e^{2t})' + 4t^2e^{2t}$
 $= (4t^2e^{2t} + 8te^{2t} + 2e^{2t}) - 4(2te^{2t} + 2te^{2t}) + 4t^2e^{2t}$
 $= (4 - 8 + 4)t^2e^{2t} + (8 - 8)te^{2t} + 2e^{2t}$
 $= 2e^{2t}$

31. Let $y_1 = \frac{e^{-t}}{2}$, $y_2 = \frac{e^{-t}}{2} + 3e^{7t}$, and $y_3 = y_2 - y_1 = 3e^{7t}$. Then

$$y_1'' - 49y_1 = \left(\frac{e^{-t}}{2}\right)'' - 49\left(\frac{e^{-t}}{2}\right) = \frac{e^{-t}}{2} - \frac{49e^{-t}}{2} = -24e^{-t}$$

$$y_2'' - 49y_2 = \left(\frac{e^{-t}}{2} + 3e^{7t}\right)'' - 49\left(\frac{e^{-t}}{2} + 3e^{7t}\right)$$
$$= \frac{e^{-t}}{2} + 147e^{7t} - \frac{49e^{-t}}{2} - 147e^{7t} = -24e^{-t}$$

$$y_3'' - 49y_3 = (3e^{7t})'' - 49(3e^{7t}) = 147e^{7t} - 147e^{7t} = 0$$

33. Let $y_1 = -e^t$, $y_2 = 6e^{4t} - e^t$, and $y_3 = y_2 - y_1 = 6e^{4t} - e^t - (-e^t) = 6e^{4t}$. Then

$$y_1'' - y_1' - 12y_1 = (-e^t)'' - (-e^t)' - 12(-e^t)$$
$$= -e^t + e^t + 12e^t = 12e^t$$

$$y_2'' - y_2' - 12y_2 = (6e^{4t} - e^t)'' - (6e^{4t} - e^t)' - 12(6e^{4t} - e^t)$$
$$= (96e^{4t} - e^t) - (24e^{4t} - e^t) - 72e^{4t} + 12e^t = 12e^t$$

Section D2.4, pp. D2-47–D2-52

1. A system is damped if the object in motion encounters resistance to the movement; otherwise the motion is undamped. The motion is free if no external forces act on the object; otherwise, the motion is forced.

3. Beats occur when the natural frequency of the oscillator ω_0 is close in value to the forcing frequency ω .

5. Find a solution y_h to the homogeneous equation. Find a particular solution y_p , form the general solution $y_h + y_p$, and evaluate constants using the initial conditions.

$$7. y = 0.75 \cos 1.2t; \text{ period} = 5\pi/3$$

$$9. y = -0.3 \cos 2t; \text{ period} = \pi$$

$$11. \theta = 0.2 \cos \sqrt{10}t; \text{ period} = 2\pi/\sqrt{10}$$

13. a. $\omega = 1.5$: $y = \frac{200}{31} \cos \frac{3}{2}t - \frac{200}{31} \cos \frac{8}{5}t$. This solution has beats.

b. $\omega = 4$: $y = \frac{25}{168} \cos \frac{8}{5}t - \frac{25}{168} \cos 4t$

15. a. $\omega = 4$: $y = \frac{1}{8} \sin 4t - \frac{1}{2}t \cos 4t$; resonance case

b. $\omega = 1$: $y = \frac{4}{15} \sin t - \frac{1}{15} \sin 4t$

17. a. $y = \frac{4}{3}e^{-8t} \sin 6t + e^{-8t} \cos 6t$; b. $y = e^{-10t} + 10te^{-10t}$; critical damping

underdamping

c. $y = -\frac{1}{3}e^{-20t} + \frac{4}{3}e^{-5t}$; overdamping

19. a. $k = 250 \text{ N/m}$ b. $y = \frac{1}{10}te^{-t}$

The maximum displacement is $\frac{1}{10}e^{-1} \approx 0.037 \text{ m}$. d. With an increase

in k of 50%, the motion becomes underdamped, maximum displacement decreases to 0.034 m. With an increase in k of 100%, the motion becomes underdamped; maximum displacement decreases to 0.032 m.

e. With a decrease in k of 50%, the motion becomes overdamped; maximum displacement increases to 0.041 m.

21. a. $y = -\frac{18}{17}e^{-t} \sin 2t - \frac{4}{17}e^{-t} \cos 2t + \frac{16}{17} \sin 2t + \frac{4}{17} \cos 2t$

b. transient solution: $y = -\frac{18}{17}e^{-t} \sin 2t - \frac{4}{17}e^{-t} \cos 2t$

steady-state: $y = \frac{16}{17} \sin 2t + \frac{4}{17} \cos 2t$

Transient solution

Steady-state solution

c. After approximately 3 seconds.

23. a. $y = c_1 e^{-t/2} \sin t + c_2 e^{-t/2} \cos t + \frac{32\omega}{16\omega^4 - 24\omega^2 + 25} \sin \omega t - \frac{32\omega^2 - 40}{16\omega^4 - 24\omega^2 + 25} \cos \omega t$

b. $y = -\frac{16\omega^2 + 20}{16\omega^4 - 24\omega^2 + 25} e^{-t/2} \sin t + \frac{32\omega^2 - 40}{16\omega^4 - 24\omega^2 + 25} e^{-t/2} \cos t + \frac{32\omega}{16\omega^4 - 24\omega^2 + 25} \sin \omega t - \frac{32\omega^2 - 40}{16\omega^4 - 24\omega^2 + 25} \cos \omega t$

c. transient solution:

$$y = -\frac{16\omega^2 + 20}{16\omega^4 - 24\omega^2 + 25} e^{-t/2} \sin t + \frac{32\omega^2 - 40}{16\omega^4 - 24\omega^2 + 25} e^{-t/2} \cos t$$

steady-state solution:

$$\frac{32\omega}{16\omega^4 - 24\omega^2 + 25} \sin \omega t - \frac{32\omega^2 - 40}{16\omega^4 - 24\omega^2 + 25} \cos \omega t$$

25. When $L = 0$, the equation $LQ'' + RQ' + \frac{1}{C}Q = E(t)$; becomes

$$RQ' + \frac{1}{C}Q = E(t). \text{ Solution is } Q = -\frac{1}{20}e^{-20t} + \frac{1}{20} \text{ and it}$$

approaches a steady-state value of $\frac{1}{20}$.

27. a. $y = 50e^{-40t} - 50e^{-60t}$; steady-state current: $y = 0$

29. a. $y = \frac{40\sqrt{15}}{3}e^{-80t} \sin 2\sqrt{15}t$ b. transient current:

$$y = \frac{40\sqrt{15}}{3}e^{-80t} \sin 2\sqrt{15}t; \text{ steady-state current: } y = 0$$

31. $Q = \frac{12}{5} - \frac{4}{5}e^{-4t}(3 \cos 3t + 4 \sin 3t); I = 20e^{-4t} \sin 3t$

33. a. True b. True c. True d. False e. False f. True

35. a. $y = 16e^{-t/4} \sin t + 128e^{-t/4} \cos t + 16 \sin t - 128 \cos t$

transient solution: $y = 16e^{-t/4} \sin t + 128e^{-t/4} \cos t$

steady-state solution: $y = 16 \sin t - 128 \cos t$

b. c. Around $t = 20$;
 $\lim_{t \rightarrow \infty} (16e^{-t/4} \sin t + 128e^{-t/4} \cos t) = 0$ so the solution approaches the steady-state solution.

37. a. $y = c_1 e^{-2t} + c_2 e^{-t} + 6 \sin 4t - 7 \cos 4t$

transient solution: $y = c_1 e^{-2t} + c_2 e^{-t}$

steady-state solution: $y = 6 \sin 4t - 7 \cos 4t$

c. In all cases, the solution approaches the steady state solution quickly. The steady-state solution has smaller magnitude than the external force function and is shifted.

$$39. \text{ a. } \cos \omega t - \cos \omega_0 t = 2 \sin \left(\frac{\omega_0 t - \omega t}{2} \right) \sin \left(\frac{\omega_0 t + \omega t}{2} \right) \\ = 2 \sin \frac{(\omega_0 - \omega)t}{2} \sin \frac{(\omega_0 + \omega)t}{2}$$

$$\begin{aligned}
 41. C^* &= \frac{F_0}{\sqrt{c^2\omega^2 + m^2(\omega_0^2 - \omega^2)^2}} = \frac{\omega E_0}{\sqrt{R^2\omega^2 + L^2\left(\frac{1}{CL} - \omega^2\right)^2}} \\
 &= \frac{\omega E_0}{\sqrt{R^2\omega^2 + \omega^2 \frac{L^2}{\omega^2} \left(\frac{1}{CL} - \omega^2\right)^2}} \\
 &= \frac{\omega E_0}{\sqrt{R^2\omega^2 + \omega^2 \left(\frac{L}{\omega} \left(\frac{1}{CL} - \omega^2\right)\right)^2}} = \frac{\omega E_0}{\omega \sqrt{R^2 + \left(\frac{L}{\omega} \left(\frac{1}{CL} - \omega^2\right)\right)^2}} \\
 &= \frac{E_0}{\sqrt{R^2 + \left(\frac{1}{C\omega} - L\omega\right)^2}} \\
 &= \frac{E_0}{\sqrt{R^2 + \left(\omega L - \frac{1}{\omega C}\right)^2}}
 \end{aligned}$$

$R^2 + \left(\omega L - \frac{1}{\omega C}\right)^2$ is smallest when $\omega L = \frac{1}{\omega C}$ or $\omega^2 = \frac{1}{CL}$.

$$43. \text{ a. } x = \frac{4\sqrt{7}}{7} e^{-3t/2} \sin \frac{\sqrt{7}}{2} t + 2e^{-3t/2} \cos \frac{\sqrt{7}}{2} t$$

c. The motion is underdamped.

$$45. \text{ a. } x = -\frac{22}{5} e^{-t/2} \sin 2t + \frac{16}{5} e^{-t/2} \cos 2t + \frac{52}{5} \sin t - \frac{16}{5} \cos t$$

c. The motion approaches a steady-state solution of

$$x = \frac{52}{5} \sin t - \frac{16}{5} \cos t.$$

47. a. There are two forces acting: inertia, given by $ma = m s''(t) = m \ell \theta''(t)$ and weight of the bob. The component of weight in the direction of motion is $mg \sin \theta(t)$. By Newton's law, the sum of the forces is 0 or $m \ell \theta''(t) + mg \sin \theta(t) = 0 \Rightarrow m \ell \theta''(t) = -mg \sin \theta(t)$.

$$\text{b. } m \ell \theta''(t) = -mg \sin \theta(t) \Rightarrow \theta''(t) = -\frac{g}{\ell} \sin \theta(t)$$

$$= -\omega_0^2 \sin \theta(t) \text{ or } \theta'' + \omega_0^2 \sin \theta = 0$$

c. Using $\sin \theta \approx \theta$ in the equation from (c) gives $\theta'' + \omega_0^2 \theta = 0$.

d. The frequency is given by $\omega_0^2 = \frac{\ell}{g}$ or $\omega_0 = \sqrt{\frac{g}{\ell}}$. The period is

$$T = \frac{2\pi}{\omega_0} = \frac{2\pi}{\sqrt{\frac{g}{\ell}}} = 2\pi \sqrt{\frac{\ell}{g}}. \text{ Doubling the length increases the period}$$

by a factor of $\sqrt{2}$. 49. a. $\theta(t) = -\frac{\sqrt{15}}{35} \sin \frac{7\sqrt{15}}{15} t + \frac{2}{5} \cos \frac{7\sqrt{15}}{15} t$

b. $\theta(t) = \frac{\sqrt{211}}{35} \sin \left(\frac{7\sqrt{15}}{15} t + \varphi \right)$ where $\tan \varphi = -\frac{14\sqrt{15}}{15}$
or $\theta(t) \approx 0.415 \sin (1.807t + 1.841)$.

c. $T = 2\pi \sqrt{\frac{\ell}{g}} = 2\pi \sqrt{\frac{3}{9.8}} = 3.476$ seconds.

51. a. $y = 0.25 \cos 2t$

b. $y = 0.25 \cos 2t$ c. $T = \pi$

53. a. $x_1' = -k_1 x_1 + k_2 x_2 + f(t) \Rightarrow x_1'' = -k_1 x_1' + k_2 x_2' + f'(t)$
 $\Rightarrow k_2 x_2' = x_1'' + k_1 x_1' - f'(t)$. Eliminate x_2 from the given first-order system by multiplying the equation for x_1' by $(k_2 + k_3)$ and the equation for x_2' by k_2 and adding. This results in $(k_2 + k_3)x_1' + k_2 x_2' = -k_1 k_3 x_1 + (k_2 + k_3)f(t)$. Substitute $k_2 x_2' = x_1'' + k_1 x_1' - f'(t)$ and solve for x_1'' to get $x_1'' = -(k_1 + k_2 + k_3)x_1' - k_1 k_3 x_1 + (k_2 + k_3)f(t) + f'(t)$. Replace x_1 with x . b. Because x is another name for x_1 , $x_1(0) = A$ is the same as $x(0) = A$. Using the first DE gives $x'(0) = x_1'(0) = -k_1 x_1(0) + k_2 x_2(0) + f(0) = -k_1 x_1(0) + f(0)$.

$$55. \text{ a. } x_1(t) = 6.59e^{-0.1322t} + 3.41e^{-0.0378t}$$

$$\text{b. } x_2(t) = -10.60e^{-0.1322t} + 10.60e^{-0.0378t}$$

Section D2.5, pp. D2-61–D2-63

1. $H(\omega) = g(\omega)e^{i\gamma(\omega)}$ 3. The phase lag function gives the phase of the output relative to the input. The output lags the input.

5. a. $g(\omega) = \frac{1}{\sqrt{(1-\omega^2)^2 + \omega^2}}$

$\tan \gamma(\omega) = \frac{\omega}{\omega^2 - 1}$

b. Local maximum of the gain function at $\omega = \frac{\sqrt{2}}{2}$.

Weak damping.

7. a. $g(\omega) = \frac{1}{\sqrt{(1-\omega^2)^2 + \frac{\omega^2}{100}}}$

$\tan \gamma(\omega) = \frac{\omega}{10(\omega^2 - 1)}$

b. Local maximum of the gain function at $\omega = \frac{\sqrt{398}}{20}$.

Weak damping.

9. a. $g(\omega) = \frac{1}{\sqrt{(10,000 - \omega^2)^2 + 22,500\omega^2}}$

$\tan \gamma(\omega) = \frac{150\omega}{\omega^2 - 10,000}$

b. Local maximum of the gain function at $\omega = 0$. Strong damping.

11. a. See Exercise 5a.

b. $\text{Re}\{y_p\} = \frac{2}{\sqrt{13}} \cos\left(2t + \tan^{-1} \frac{2}{3} - \pi\right)$
 $\approx 0.555 \cos(2t - 2.554)$

13. a. See Exercise 7a.

b. $\text{Re}\{y_p\} = \frac{50}{\sqrt{6409}} \cos\left(3t + \tan^{-1} \frac{3}{80} - \pi\right)$
 $\approx 0.625 \cos(3t - 3.104)$

15. a. See Exercise 9a.

b. $\text{Re}\{y_p\} = \frac{\sqrt{2}}{750} \cos(200t + \tan^{-1} 1 - \pi)$
 $\approx 0.00189 \cos(200t - 2.356)$

17. a. $g(\omega) = \frac{1}{\sqrt{(72 - \omega^2)^2 + 100\omega^2}}$

b. Local maximum of the gain function at $\omega \approx \sqrt{22}$. c. $(\sqrt{22}, \infty)$

$$\text{d. } \left| \frac{v_{\text{out}}}{v_{\text{in}}} \right| = \frac{72}{\sqrt{(72 - \omega^2)^2 + 100\omega^2}}$$

$$19. \text{ a. } g(\omega) = \frac{1}{\sqrt{(15 - \omega^2)^2 + 2500\omega^2}}$$

b. Local maximum of the gain function at $\omega = 0$. c. $[0, \infty)$

$$\text{d. } \left| \frac{v_{\text{out}}}{v_{\text{in}}} \right| = \frac{15}{\sqrt{(15 - \omega^2)^2 + 2500\omega^2}}$$

21. a. True b. True

23. a. With 1 in the numerator, the smaller the denominator, the larger the value of $g(\omega)$. b. A square root will be smallest when the quantity under the square root is smallest.

$$\text{c. } h'(\omega) = \frac{d}{d\omega}[(\omega_0^2 - \omega^2)^2 + b^2\omega^2] = 2(\omega_0^2 - \omega^2)(-2\omega) + 2b\omega$$

$$= 2\omega(-2(\omega_0^2 - \omega^2) + b) = 2\omega(b - 2\omega_0^2 + 2\omega^2)$$

d. From part (c), $h'(\omega) = 2\omega(b^2 - 2\omega_0^2 + 2\omega^2)$. If $b < \sqrt{2}\omega_0$, then $h'(\omega) = 0$ has a real solution: $b^2 - 2\omega_0^2 + 2\omega^2 = 0$

$$\Rightarrow 2\omega^2 = 2\omega_0^2 - b^2 \Rightarrow \omega = \sqrt{\frac{2\omega_0^2 - b^2}{2}} = \sqrt{\omega_0^2 - \frac{b^2}{2}}$$

That this gives a local minimum for h , and hence a local maximum for g , can be verified by the First or Second Derivative Tests. The

maximum value of g is $\frac{\sqrt{2}}{\sqrt{b^2 + b^2(2\omega_0^2 - b^2)}}$.

e. If $b \geq \sqrt{2}\omega_0$, then $b^2 \geq 2\omega_0^2$ and $b^2 - 2\omega_0^2 + 2\omega^2 \geq 0$. Hence $h'(\omega) = 2\omega(b^2 - 2\omega_0^2 + 2\omega^2) \geq 0$ for $\omega \geq 0$ and h is an increasing

function. It follows that $g = \frac{1}{\sqrt{h}}$ is decreasing for $\omega \geq 0$ and so

has a local maximum at $\omega = 0$. f. Part (e); the gain function is maximized at 0.

$$25. \text{ a. } g(\omega) = \frac{1}{\sqrt{(\omega^2 - 1250)^2 + 1600\omega^2}}$$

b. Increases until $\omega = 15\sqrt{2}$ then decreases.

$$\text{c. } \left| \frac{v_{\text{out}}}{v_{\text{in}}} \right| = \frac{\omega^2}{\sqrt{(\omega^2 - 1250)^2 + 1600\omega^2}}$$

$$27. \text{ a. } g(\omega) = \frac{4}{\sqrt{16(\omega^2 - 50)^2 + \omega^2}}$$

b. Increases until $\omega = \frac{\sqrt{3198}}{8} \approx 7.069$ then decreases.

$$\text{c. } \left| \frac{v_{\text{out}}}{v_{\text{in}}} \right| = \frac{4\omega^2}{\sqrt{16(\omega^2 - 50)^2 + \omega^2}}$$

Chapter D2 Review Exercises, pp. D2-63–D2-64

1. a. True b. False c. False d. False e. True

$$3. y = c_1 e^{-2t} + c_2 e^{4t} \quad 5. y = c_1 \sin 6t + c_2 \cos 6t$$

$$7. y = c_1 e^{-2t} + c_2 t e^{-2t} \quad 9. y = c_1 e^t \sin 2t + c_2 e^t \cos 2t$$

$$11. y_p = \frac{1}{7} \cos 2t \quad 13. y_p = -\frac{1}{6}t - \frac{5}{36} - \frac{1}{5}e^{-t}$$

$$15. y_p = \frac{1}{4}t \sin 4t \quad 17. y = c_1 \sin 2t + c_2 \cos 2t - \frac{3}{5} \sin 3t$$

$$19. y = c_1 e^{-2t} \sin t + c_2 e^{-2t} \cos t + \frac{1}{4} \sin t + \frac{1}{4} \cos t$$

21. $y = c_1 e^{-t} + c_2 e^t + t e^t$

23. a. $y = \frac{3\sqrt{7}}{7} e^{-15t/2} \sin \frac{5\sqrt{7}}{2} t + e^{-15t/2} \cos \frac{5\sqrt{7}}{2} t$; underdamping

b. $y = e^{-10t} + 10t e^{-10t}$; critical damping

c. $y = -\frac{1}{3} e^{-20t} + \frac{4}{3} e^{-5t}$; overdamping

25. a. $I = 50e^{-60t} - \frac{600}{13} e^{-40t} + \frac{250}{13} \sin 60t - \frac{50}{13} \cos 60t$

b. Transient current:

$$I = 50e^{-60t} - \frac{600}{13} e^{-40t}$$

c. Steady-state current:

$$I = \frac{250}{13} \sin 60t - \frac{50}{13} \cos 60t$$

d. The solutions are the same.

 translation and rotation of, GP58

B

Balls, GP69
 closed, 820
 open, 820
 spheres and, 820, 865e

Basins of attraction, 273e

Bernoulli, Johann, 257, 404e

Bernoulli equations, solutions to, 626e

Bernoulli's parabolas, 404e

Bessel functions, 749e

Bezier curves, GP64

Binary numbers, 669e

Binomial coefficients, 735

Binomial series, 735, 742e, 751e
 working with, 736, 741e

Binormal vector, 909–912
 completing, 913e
 computing, 918e
 unit
 defining, 910
 formulas for, 912

Bioavailability, 588–589

Bisection
 of ellipses, 802e
 of regions, 372e

Body mass index, 949e

Boiling-point function, 35e

Boundary points
 interior points and, 933
 limits at, 933–935

Bounded intervals, B-1

Bounded sequences
 above, 651
 below, 651
 monotonic, 655

Bounded sets, 988

Bounds
 on definite integrals, 310–311
 on e , 456
 of functions, 925
 on integrals, 336e
 lower, 311
 of series, 681e, 706e
 of regions, 1029
 upper, 311
 of series, 681e, 706e

Bowls, sine, 390

Boxes, volume of, 950e

Boyle's Law, 192e

Brahe, Tycho, 897

Branchistochrone property, 546

Buoyancy, GP26

Business, derivatives in, 159–163

b^x , derivatives of, 360

C

Calculator limits, 52e

Calculus. *See also* Fundamental Theorem of Calculus
 geometry and, 367–368, 370e

 - carrying capacity and, 627
 - defining, 278, 597
 - domain of solutions to, 598
 - Euler's method for, GP33
 - first-order, GP31, GP33, GP36, GP38, GP39, 620–625
 - general solutions, 278, 598
 - growth rate functions and, 627
 - initial value problems and, 278–279, 598–600
 - linear, 597–598

Differential equations (*continued*)

- motion and, 601–602
- nonlinear, 597–598
- order of, 597
- population models and, 627–629
- predator-prey models and, 631–633
- second order, GP27, GP40, GP65, GP66, GP75, GP76, 605e
- separable, 614–618
 - implicit solutions, 616
- stirred tank reactions and, 629–631
- verifying solutions to, 598–599

Differentials, 256e

- as change, 254
- change and, 977–980
- defining, 254, 978
- linear approximation and, 247–254
- logarithmic, 983e

Differentiation

- implicit, 177–180, 181e, 945, 955–957, 959e, 1006e
 - geometry of, 960e
- integration and, 321
- logarithmic, 452–453, 454e
- numerical, GP11
- of power series, 730e, 743–744
- rules of, 130–140

Dipstick problem, GP27

Direction

- of change, 965, 972e
- of steepest ascent, 965, 971e
- of steepest descent, 965, 971e

Directional derivatives, 1006e

- computing, 963e
- defining, 962
- gradient and, 961–970
- interpreting, 966–967, 971e

Direction fields, 637e

- analysis, 613e, 622–623
- defining, 606–611
- equilibrium solutions to, 608
- matching, 611e
- sketching, 608, 612e
- with technology, 612e

Directrix

- conic sections and, 793–795
- of parabolas, 789

Discontinuity

- classifying, 93e
- infinite, 93e
- jump, 83, 93e
- points of, 83, 106e
- removable, 83, 93e

Discriminants, 986

Disk method, 391

- defining, 376
- about x -axis, 376, 394
- about y -axis, 379, 394

Displacement, 155

- approximation of, 288, 297e
- defining, 352
- distance and, 425e
- oscillator, 531e

- from velocity, 299e, 349e, 351–353, 358e, 359e, 425e
- velocity curve and, 288–289

Distance, 1060e

- average
 - on parabolas, 335e
 - on triangle, 345e
- displacement and, 425e
- to ellipse, 1003e
- formulas, B-4, 819
- function, 972e
- to paraboloid, 1007e
- to planes, 1003e
- from plane to ellipsoid, 983e
- from point to line, 846–849
- position and, 425e
- to sphere, 1003e
- to surface, 1003e
- traveled, 352

Distribution, normal, 745

Distribution of wealth, GP19, 372e

Distributive property, 811, 836e

Divergence, 1145e

- computing, 1137
- curl and, 1183e
- of gradient fields, 1146e
- from graphs, 1138
- of infinite series, 645
- Product Rule for, 1142
- proof, 682e
- of radial vector field, 1138–1139, 1144e, 1146e
- two-dimensional, 1127
- of vector field, 1137–1138, 1143e
- working with, 1141–1143

Divergence test, 672–673, 680e, 689, 701t

- application of, 700–702

Divergence Theorem, 1171–1179, 1180e

- for hollow regions, 1176–1177
- mass transport and, 1174
- proof of, 1175–1176
- with rotation field, 1173
- verification of, 1172

Divergent sequences, 658

- defining, 642

Division

- long, 553–554
- with rational functions, 522

Domain, 35e, 229, 231, 869, 874e, 927e, 1005e

- in context, 3
- defining, 1, 920
- determining, 600
- of differential equation solutions, 598
- finding, 920
- of functions, 2
- in graphing, 228
- with independent variables, 926
- of natural logarithm, 445
- of two variables, 920

Dot Product Rule, 878

- proof of, 879

Dot products, 827–833

- applications of, 832–833
- defining, 827
- force and, 832
- forms of, 827
- properties of, 830, 846e
- work and, 832

Double-angle identities, 29

Double integrals, 1015e, 1082e, 1085, 1088e

- area by, 1023
- with change of variables, 1076
- defining, 1010
- orders of, 1011
- over general regions, 1017–1023
- over polar rectangle, 1028
- over rectangular regions, 1008–1014
- in polar coordinates, 1027–1032

Doubling time, 470, 477e

Drug dosing, GP43, 625e

- half-lives and, 474
- initial value problems for, 622
- periodic, 660e
- sequences for, 655

Dummy variables, 293

E

e (number)

- approximation of, 449
- bounds on, 456e
- defining, 447
- properties of, 448

e^x

- derivative of, 450
- integrals with, 451
- properties of, 448

Earth, speed of, 901e

Earth-Mars system, 778e

Earthquakes, GP67

Eccentricity, conic sections and, 793–795

Eccentricity-Directrix Theorem, 794, 798e

- proof of, AP-6

Ecological diversity, GP67

Economics

- derivatives in, 159–163
- elasticity in, GP13, 162
- models, 1001–1002
- production functions, GP68
- stimulus packages, GP44

Edges, center of mass on, 1072e

Eiffel Tower, GP72

Eigenvalues, defining, 272e

Elasticity

- defining, 162
- demand and, 165e
- in economics, GP13, 162
- inelasticity, 163
- price, of demand, 162

Electric field, 62e, 545e

- point charges and, 1097e

Electric potential, 1146e

- function, 925, 929, 950e

- Ellipses, 765e, 1083e
 - arc length of, 581e, 898
 - area of, 544e, 981e, 1126
 - bisection of, 802e
 - center of, 791
 - confocal, 800e
 - construction of, 802e
 - defining, 760
 - distance from plane to, 983e
 - distance to, 1003e
 - equations of, 792, 794–795, 797e
 - foci of, 791
 - graphing of, 792
 - parabolas and, 799e
 - parametric equations of, 760, 766e
 - properties of, 794
 - rectangles in, 1003e
 - speed on, 894e
 - tangent line for, 798e
 - tilted, 896e
 - trajectories on, 887
 - vertices of, 791
- Ellipsoid, 1047e
 - defining, 858
 - inside tetrahedron, 996e
 - surface area of, 410e
 - volume of, 799e, 1007e
- Elliptic cones, 861
- Elliptic curves, 236e
- Elliptic cylinders, 857
- Elliptic integrals, 749e, 898
- Elliptic paraboloids, 859
- End behavior
 - of algebraic functions, 78–79
 - asymptotes and, 231
 - of cosine function, 79
 - determining, 228
 - of limits at infinity, 229
 - of rational functions, 76, 78, 81e
 - of sine function, 79
- Endowment models, 626e
- Endpoints, continuity at, 86, 330e
- Energy, 167e
 - conservation of, 959e, 1123e
 - consumption, 472
 - power and, 362e
- Enzyme kinetics, GP12
- Epidemic models, 495
 - logistic equation for, 619e
- Equal areas, 345e
 - for parabolas, 372e, 429e
 - property, 896e
- Equal derivatives, 213e
- Equality
 - components and, 814e
 - of partial derivatives, 944–945
- Equal vectors, 805
- Equal volumes, 398e, 1035e
- Equations. *See also* Differential equations; Parametric equations

 area function and, 316–319
 consequences of, 356
 discrete version of, 330e
 proof of, 325
- Fundamental Theorem of Line Integrals,
 1121e, 1122e, 1179*t*
- Funnels, surface area of, 408–409
- G**
- Gabriel's horn, 585
 - Gamma function, 593e
 - Gauss' formula, 1181e
 - Gaussians, 593e
 - Gauss' Law, 1177–1179, 1180e
 - General equations of planes, 850
 - General exponential functions, 457
 - Generalized Mean Value Theorem, 214e, 334, 336e
 - Generalized sum rule, 133
 - General logarithmic functions, 457–459
 - derivatives of, 464–465
 - General partition, 304
 - General Power Rule, 466e
 - defining, 462
 - General regions
 - circulation on, 1128–1130
 - description of, 1034e
 - double integrals over, 1017–1023
 - flux on, 1128–1130
 - General Riemann sum, 304
 - General rotation vector field, 1140
 - General solutions, 598
 - differential equations, 278, 598
 - finding, 605e
 - graphs of, 282e
 - verification of, 604e
 - Geometric-arithmetic mean, 836e
 - Geometric limits, 264e
 - Geometric means, 477e, 517e, 1004e
 - Geometric probability, GP23
 - Geometric sequences, 652–654
 - defining, 653
 - limit laws and, 653
 - Geometric series, 639, 663, 701*t*, 742e
 - decimal expansions as, 664–665
 - evaluating, 668e, 700
 - power series from, 751e
 - Geometric sums, 663–665, 668e
 - Geometry, 565e
 - area by, 347e
 - area function by, 348e
 - calculus and, 367–368, 370e
 - of cross product, 838
 - for definite integrals, 306–307
 - Lagrange multipliers and, 1000–1001
 - of l'Hôpital's Rule, 258
 - of Substitution Rule, 343
 - Geometry functions, 441e
 - Gini index, 372e
 - Gompertz equation, 629
 - solutions to, 634e
 - Gompertz growth model, 628
 - Gradient
 - computing, 964
 - defining, 964
 - directional derivatives and, 961–970
 - of distance function, 972e
 - interpretations of, 965–967
 - level curves and, 967–968
 - rules, 973e
 - in three-dimensions, 969–970
 - vector, 964–965
 - Gradient fields, 1096e, 1182e
 - on curves, 1097e
 - defining, 1094
 - divergence of, 1146e
 - potential functions and, 1094
 - Graphs and graphing
 - analysis of, 226e, 227
 - approximation of area from, 296e, 297e
 - area function from, 329e
 - Cartesian, matching, 774
 - of conic sections, 797
 - of cosine, 33e
 - critical points in, 228
 - of curl, 1170e
 - of curvature, 914e

Graphs and graphing (*continued*)

- of curves, 873e
- defining, 2
- definite integrals from, 307–308, 315e
- of derivatives, 122–124, 146e
- divergence from, 1138
- domain in, 228
- of ellipses, 792
- exponential functions, 466e
- finding limits from, 45–46
- of functions, 24e, 228–234, 234e, 927e
 - of two variables, 921–924
- functions matched with, 874e
- of general solutions, 282e
- guidelines, 228–234
- of hyperbolic functions, 501–502
- inverse functions, 435–436, 440e
- levels curves and, 919–927
- limits by, 52e
- linear functions, 15, 23e
- logarithmic functions, 466e
- Mean Value Theorem, 212e–213e
- piecewise functions, 16–17
- polar
 - matching, 774
 - plotting, 771–773
 - symmetry in, 772–773
- polar coordinates in, 771–774
- power functions, 16–17
- root functions, 17
- semicircles, 13e
- of sequences, 652
- of sine, 33e
- sketching, 81e
- of spirals, 870
- of surfaces, 856
- symmetry in, 228
 - defining, 8
- of Taylor polynomials, 719e
- transformations of, 20–22, 31, 35e
- of trigonometric functions, 30–31
- using, 14–20
- utilities, 96, 774–775
- values from, 102e
- velocity, 359e
- windows, 228

Gravitational fields, GP74, 1063e

- mass and, 1097e
- motion in, 158, 356, 601
- two-dimensional motion in, 887–892
- work in, 424e

Gravitational potential, 973e

Gravity

- acceleration and, 281
- motion with, 280, 283e, 286e
- variable, 363e

Grazing goat problems, GP57

Green's Theorem, 1168, 1179*t*, 1183e

- area calculated by, 1126
- circulation form of, 1124–1128
- flux form of, 1127–1128, 1134e
- proof of, 1131

Grids

- Euler's method on general, 613e
- nonuniform, 579e
- points, 290

Growth models, 158–159

- of functions, 925
- Gompertz, 628

Growth rates

- absolute, 469, 475e
- constant, 469
- annual, 472
- comparable, 496, 498e, 517e
- convergence and, 657
- exponential, 469–473, 475e, 499e
- factorial, 499e
- functions, 627, 634e, 635e
 - differential equations and, 627
- of functions, 495–497
- l'Hôpital's Rule and, 493–497
- oscillating, 362e
- ranking, 497
- relative, 475e
 - constant, 469
- of sequences, 656–657, 660e

H

Hadamard, Jacques, 496

Hailstone sequence, 662e

Half-angle formula, 533

Half-angle identities, 29, 29

Half-annulus, circulation on, 1128

Half-life, 473

- of common drugs, 474

Hand tracking, 864e

Harmonic functions, 1181e

Harmonic series, 673, 951e

- alternating, 688
- defining, 674
- Fibonacci sequence and, 682e

Harmonic sums, 456e

Harvesting models, 602

Heat

- flux, 836e, 1113e, 1145e
- transfer, 1181e

Heaviside function, 51e

Height

- of arches, 335e
- average, 349e
- functions, 235e
- of shells, 388
- of waves, 335e

Helical trajectories, 896e

Helix

- curvature of, 905–906
- parameterization for, 898
- principal unit normal vectors for, 907

Hemispheres

- flux across, 1184e
- parabolic, volume of, 375
- volume of, 386e

Heron's formula, 982e

Hessian matrix, 986

Hexagonal circle packing, 836e

Hexagonal sphere packing, 836e

Higher-order derivatives, 134–135, 145e, 194e, 466e, 882e

- functions from, 283e
- of implicit functions, 180
- partial, 944–945
- trigonometric, 152

Hollow regions, Divergence Theorem for, 1176–1177

Hooke, Robert, 414

Hooke's law, 413–414

Horizontal asymptotes, 18, 80e, 81e

- limits at infinity and, 72–74

Horizontal channel flow, 1167

Horizontal lines, B-6

Horizontal line test, defining, 431

Horizontal motion, 195e

Horizontal plane, 1049*t*

- in spherical coordinates, 1055*t*

Horizontal tangent line, 154e, 464

Horizontal tangent plane, 982e

Hydrostatic pressure, 419

Hyperbolas, 792–793, 803e

- anvil of, 800e
- area of, 799e
- asymptote of, 792
- confocal, 800e
- constructions for, 799e
- equations of, 793, 797e, 799e
- foci of, 792
- properties of, 794
- sectors of, 800e
- tangent line for, 798e
- tracing, 798e
- vertex of, 792

Hyperbolic cap, volume of, 799e

Hyperbolic field, 1113e

Hyperbolic functions, GP28

- applications of, 509–511
- Chain Rule and, 504, 508
- defining, 500
- derivatives of, 502–505, 519e
- evaluation of, 513e
- graphs of, 501–502
- identities of, 500–502, 501
- integrals of, 502–505
- inverse, 505
 - derivatives of, 507–509
 - intersection points in, 506–507
 - as logarithms, 506
- Product Rule and, 504
- trigonometric functions and, 499–500

Hyperbolic paraboloid, 860, 1035e

Hyperboloid

- of one sheet, 859
- solids bounded by, 1033e
- of two sheets, 861

Hypervolume, 1047e

Hypocycloid, 762

- I**
- Ice cream, GP16
- Ideal flow, 1135e
- Ideal Gas Law, 255e, 930e, 945
 - calculation of, 949e
- Identical limits of integration, 308
- Identities, 32e, 490e, 511, 844e, 951e
 - double-angle, 29
 - half-angle, 29, 29
 - of hyperbolic functions, 501
 - inverse, 514e
 - inverse tangent, 212e
 - proofs of, 492e, 514e
 - Pythagorean, 29, 532
 - reciprocal, 29–30
 - trigonometric, C-4, 29–30
- Image of transformation, 1073–1074
- Imaginary axis, C-1
- Imaginary part, C-1
- Implicit differentiation, 177–180, 181e, 945, 955–957, 959e, 1006e
 - geometry of, 960e
- Implicit formula for sequences, 640
- Implicit functions, higher-order derivatives of, 180
- Improper integrals, 582–586, 1027e, 1035e
 - comparison test for, 589–590
 - convergence of, 587
 - divergence of, 587
 - over infinite intervals, 583
 - with unbounded integrand, 587
- Inclined planes, 866e
 - force on, 834e
- Increasing functions
 - concavity and, 231
 - defining, 214
 - derivatives and, 214–216
 - intervals of, 214–215
 - sketching, 215–216
- Increasing sequences, 651
- Indefinite integrals, 282e, 343e, 461–462, 880
 - antiderivatives and, 275
 - general formulas for, 340–341, 520
 - integration by parts for, 525–527
 - Power Rule for, 275
 - Substitution Rule and, 337–340
 - of trigonometric functions, 276–277
 - verification of, 283e
- Independent variables, 64, 647*t*, 899
 - Chain Rule
 - with one, 952–953, 958e
 - with several, 953–954
 - defining, 2
 - domain with, 926
 - function with, 926
 - Lagrange multipliers
 - with three, 999–10002
 - with two, 997–999
 - range with, 926
- Indeterminate forms, 495
 - l'Hôpital's Rule and, 258, 259–261
 - procedures for, 494
- Index, 293
 - defining, 639
- Indifference curves, 1001
- Individual objects
 - on lines, 1064
 - sets of, 1063–1064
- Induction, mathematical, 656
- Inelasticity, 163
- Inequalities
 - solutions to, B-2
 - test values and, 216
 - triangle, 816e, 836e
 - trigonometric, 63e
- Infinite discontinuity, 93e
- Infinite integrands, 587
 - at interior point, 588
- Infinite intervals, 582–586
 - accumulation over, 647*t*
 - evaluation of, 583
 - improper integrals over, 583
 - solids of revolution and, 585
- Infinite limits, 63–69
 - analytical determination of, 67–69, 70e
 - defining, 65, 100–102
 - at infinity, 74–75
 - one-sided, 65
 - proofs of, 101–102
 - two-sided, 101
- Infinite products, 688e
- Infinite series, GP47, GP49, 639, 662–667, 748e

- unbounded, B-1

Inverse

- of composite functions, 442e
- of cubics, 442e
- existence of, 516e
- relations, 456e

Inverse cosine, 490e

- defining, 478
- derivatives of, 492e
- graphing, 479–480
- working with, 479

Inverse functions

- continuity of, 436
- defining, 430
- derivatives of, 436–437, 441e, 516e
- existence of, 430–431
- finding, 433–434, 440e, 456e, 516e
- graphing, 435–436, 440e
- integration of, 531e

Inverse hyperbolic functions, 505

- derivatives of, 507–509
- intersection points in, 506–507
- as logarithms, 506

Inverse identities, 514e

Inverse properties for $\ln x$, 447

Inverses, of quartics, 442e

Inverse sine, GP30, 490e, 730e

- defining, 478
- derivative of, 482–484, 492e
- graphing, 479–480
- working with, 479

Inverse square field, flux for, 1176–1177

Inverse square force, 1105

Inverse tangent

- derivative of, 484–488
- identities, 212e

Irreducible quadratic factors, 551–554

- partial fractions with, 552
- repeated, 554
- simple, 554

Irrotational, 1125

Isogonal curves, 788e

Isosceles triangle

- expanding, 188e
- shrinking, 188e

Iterated integrals, 1010–1014, 1015e

- evaluation of, 1011–1012

Iterations, 266e

- fixed-point, 649e

J

Jacobian determinants, 1084e

- of polar-to-rectangular transformation, 1075–1076
- of transformation of two variables, 1075
- of transformations of three variables, 1075

Joules, 472

Jump discontinuity, 83, 93e

Jumps, functions with, 48–49

Jupiter, speed of, 901e

K

Kepler, Johannes, 897

Kilowatt-hour (kWh), 472

Kilowatts, 362e

L

Lagrange multipliers, 996

- applications of, 1003
- geometry problems and, 1000–1001
- with three independent variables, 999–1002
- with two independent variables, 997–999

Lamé curves, 236e, 803e

Laplace's equation, 951e, 1005e, 1130

Laplace transforms, 593e

Laplacian, 1142

Lapse rate, 175e, 209

- atmospheric, 212e

Latitude, 1060e

Latus rectum, 800e

Law of Cosines, 33e, 981e

Law of Sines, 33e

- Leading terms, 666

 comparing, 385, 427e, 530e, 595e
 of cones, 242e, 386e, 410e
 changes in, 981e

Volume (*continued*)

- of cylinders, 386e, 410e, 1007e
 - in spheres, 1003e
- in cylindrical coordinates, 1060e, 1086e
- as definite integral, 388
- of ellipsoid, 799e, 1007e
- equal, 398e, 1035e
- estimating, 386e
- Fermat's calculation of, 385
- formulas, 1047e, 1063e
- of hemispheres, 386e
- of hyperbolic cap, 799e
- integrals, 1040
- miscellaneous, 1062e
- of parabolic cube, 374
- of paraboloids, 799e, 981e, 1029
- of prisms, 1039
- problems, 517e
- of pyramids, 958e
- by shells, 387–395
- by slicing, 373–382
- of solids, 427e, 524e, 555, 1008–1010, 1044e, 1085e
- of spheres, 391–392, 397e, 1035e
- of spherical cap, 182e
- in spherical coordinates, 1060e, 1087e
- surface area and, 427e
- between surfaces, 1033e, 1053
- technology for, 1026e
- of tetrahedrons, 1021
- of torus, 182e, 386e, 959e
- by washer method, 378

Vorticity, 1146e

W

- Wallis products, 596e
- Washer method, 391
 - defining, 377
 - shell method and, 397e
 - volume by, 378
 - about x -axis, 377, 394
- Water, depth, 510
- Water clock, designing, GP25
- Watts, 362e, 472
- Wave equation, 951e
- Waves
 - height of, 335e
 - length of, 513e
 - traveling, GP66, 972e, 973e
 - velocity of, 510–511, 513e
- Weierstrass, Karl, 94
- Work
 - calculating, 832
 - defining, 413, 832
 - dot products and, 832
 - from force, 421e
 - in force field, 1105, 1122e
 - function, 421e
 - in gravitational fields, 424e
 - integrals, 1104–1105, 1112e
 - physical applications, 413–414
 - springs and, 421e, 428e
 - sum of, 413

X

- x -axis
 - disk method about, 376, 394
 - shell method about, 394

- symmetry, 8, 772
 - washer method about, 377, 394
- xyz -coordinate system, 817
 - distances in, 819
 - origin in, 818
 - points in, 818
- xz -plane, 817

Y

- y -axis
 - disk method about, 379, 394
 - revolution about, 378–379
 - shell method about, 394
 - symmetry, 8, 772
 - washer method about, 394
- y -coordinate, average, 1032
- yz -plane, 817

Z

- Zeno's paradox, 670e
- Zero average value, 1016e
- Zero curl, 1171e
- Zero curvature, 915e
- Zero derivatives, constant functions and, 210
- Zero log integral, 595e
- Zero net area, 316e, 330e
- Zeros, 13
- Zero scalar, multiplication by, 811
- Zero vector, 805
 - multiplication by, 811
- Zero velocity, 44e
- Zeta function, 681e

Index of Applications

Economics and Business

Automobile purchase, 26
Average and marginal cost, 160, 167, 362
Average marginal production, 166
Bad loans, 626
Car loans, 670
Compounding, 471
Consumer Price Index, 469, 649
Demand functions, 165
Depreciation of equipment, 471
Economic models, 1001–1002
Economics, 162–163, GP5, GP13, GP19, GP44, GP68
Elasticity, 163, 165
Endowment models, 626
Finance, GP42, GP44, GP45
Financial models, 471
Fuel economy, 167
Gini index, 372, GP19
House loans, 670
Inflation, 470
Interest rates, 92
Investment problems, 92
Loan payments, 623, 625, 670
Mortgage payments, 92
Oil production, 361, 572, 580
Periodic savings, 668
Perpetual annuities, 591
Production costs, 358
Profit maximization, 206
Retirement accounts, 271
Revenue function, 167
Rising costs, 475
Savings plans, 475, 517, 660, 705, 929
Shipping regulations, 993, 1003
Supply and demand, GP5
Utility functions, 959, 1001–1002
Wealth distribution, 707

Engineering and Physical Sciences

Acceleration, 156–157, 282, 360
Air drops, 764, 765
Airline travel, 164
Airplane pressure, 1016
Air resistance, 477
Arm torque, 843
Atmospheric CO_2 , GP7
Atmospheric pressure, 471
Avalanches, 213
Bike race, 363
Bike rides, 517
Black holes, 593
Blocks on springs, 34
Boat rates, 196
Boats in currents, 815

Boats in wind, 815
Boiling points, 35
Bouncing balls, 643, 649, 707
Box volume, 206
Bubbles, 671
Building tunnels, 706
Buoyancy, 424, GP26
Canoes in currents, 866
Carbon dating, 362, 476
Carbon uptake, 362
Cardboard boxes, 27, 993
Cars, 914
Car velocity, 165
Catenary, 509
Center of mass, GP72
Change in energy, 412
Channel flow, 778
Chaos, GP41
Chemical rate equations, 605, 613, 620
Clock hands, 192
Coiling ropes, 421
Comparing volumes, 595
Compressing a spring, 413, 421
Computing torque, 843
Conservation of energy, 959, 1123
Converging airplanes, 185
Cooling a bowl, 624
Cooling times, 626
Crankshafts, 245
Crosswinds, 815, 823, 825
Crystal lattice, GP48
Cycling distances, 360
Deceleration, 360, 425
Deep-water velocity equation, 510
Depletion of natural resources, 456
Descent times, 546
Diagnostic scanning, 466
Displacement, 297, 301, 350, 352, 358, 359
Distance traveled, 12, 286, 359
Dogs running, 243
Double glass windows, 670
Drag racer acceleration, 212
Draining pools, 423, 591
Draining tanks, 11, 190, 421, 422, 605
Draining troughs, 192, 422
Draining water heaters, 189
Drinking juice, 423
Driving speeds, 255
Earth-Mars system, 778
Earthquake magnitudes, 465
Eiffel Tower, 592, GP70
Electric field integrals, GP70
Electric fields, 62, 1097, 1180
Electric potential, 973, 1006
Electronic chips, 591
Electron speed, 844
Electrostatic force, 145

Elevation, 12, 196, 285, 927
Elevators, 190
Energy consumption, 472
Engines, 813
Enzyme kinetics, GP12
Equilibrium, 825
Escape velocity, 593
Falling bodies, 514
Feather dropped on moon, 165
Ferris wheels, 192
Filling bowls, 386, 1035
Filling reservoirs, 361
Filling swimming pools, 189, 192, 421
Filling tanks, 196, 357, 361
Firing angles, 917
Flow from tanks, 167, 603
Flow rate, 283, 300, 361, 578
Fluid forces, 428
Flying into headwind, 360, 1112
Flying kites, 189
Force on buildings, 423
Force-on-dam problems, 420, 422, 428
Force on inclined plane, 834
Force on protons, 841
Force on windows, 423
Four-cable loads, 826
Free falls, 10, 158, 605, 613, 619, 620
Fuel consumption, 425
Gas law calculations, 949
Gas tanks, 1063
Gateway Arch, 335, 403
Glass design, 865
Golden Gate cables, 403, 798
Gravitational fields, 158, 356, 423, GP74
Gravitational force, 145, 833, 1063, 1123
Gravitational potential, 1145
Growing sandpiles, 189
Hand tracking, 864
Harvesting model, 602
Head start problem, 283
Heat equation, 950
Heat flux, 1145, 1161
Heat transfer, 1181
Hot air balloons, 188, 189, 196
Hydrostatic pressure, 419
Ideal fluid flow, GP75
Ideal Gas Law, 930, 960
Jet altitude, 191, 465
Kiln design, 514
Knee torque, 866
Ladders, 34, 190
Lapse rate, 175, 209, 212
Launching a rocket, 11, 187, 190
Leaky buckets, 421, 423, 428

TABLE OF INTEGRALS

Substitution Rule	Integration by Parts
$\int f(g(x))g'(x) dx = \int f(u) du \quad (u = g(x))$	$\int u dv = uv - \int v du$
$\int_a^b f(g(x))g'(x) dx = \int_{g(a)}^{g(b)} f(u) du$	$\int_a^b uv' dx = uv \Big _a^b - \int_a^b vu' dx$

Basic Integrals

1. $\int x^n dx = \frac{1}{n+1} x^{n+1} + C; n \neq -1$
2. $\int \frac{dx}{x} = \ln |x| + C$
3. $\int \cos ax dx = \frac{1}{a} \sin ax + C$
4. $\int \sin ax dx = -\frac{1}{a} \cos ax + C$
5. $\int \tan x dx = \ln |\sec x| + C$
6. $\int \cot x dx = \ln |\sin x| + C$
7. $\int \sec x dx = \ln |\sec x + \tan x| + C$
8. $\int \csc x dx = -\ln |\csc x + \cot x| + C$
9. $\int e^{ax} dx = \frac{1}{a} e^{ax} + C$
10. $\int b^{ax} dx = \frac{1}{a \ln b} b^{ax} + C; b > 0, b \neq 1$
11. $\int \ln x dx = x \ln x - x + C$
12. $\int \log_b x dx = \frac{1}{\ln b} (x \ln x - x) + C$
13. $\int \frac{dx}{x^2 + a^2} = \frac{1}{a} \tan^{-1} \frac{x}{a} + C$
14. $\int \frac{dx}{\sqrt{a^2 - x^2}} = \sin^{-1} \frac{x}{a} + C, a > 0$
15. $\int \frac{dx}{x\sqrt{x^2 - a^2}} = \frac{1}{a} \sec^{-1} \left| \frac{x}{a} \right| + C, a > 0$
16. $\int \sin^{-1} x dx = x \sin^{-1} x + \sqrt{1 - x^2} + C$
17. $\int \cos^{-1} x dx = x \cos^{-1} x - \sqrt{1 - x^2} + C$
18. $\int \tan^{-1} x dx = x \tan^{-1} x - \frac{1}{2} \ln (1 + x^2) + C$
19. $\int \sec^{-1} x dx = x \sec^{-1} x - \ln (x + \sqrt{x^2 - 1}) + C$
20. $\int \sinh x dx = \cosh x + C$
21. $\int \cosh x dx = \sinh x + C$
22. $\int \operatorname{sech}^2 x dx = \tanh x + C$
23. $\int \operatorname{csch}^2 x dx = -\coth x + C$
24. $\int \operatorname{sech} x \tanh x dx = -\operatorname{sech} x + C$
25. $\int \operatorname{csch} x \coth x dx = -\operatorname{csch} x + C$
26. $\int \tanh x dx = \ln \cosh x + C$
27. $\int \coth x dx = \ln |\sinh x| + C$
28. $\int \operatorname{sech} x dx = \tan^{-1} \sinh x + C = \sin^{-1} \tanh x + C$
29. $\int \operatorname{csch} x dx = \ln |\tanh (x/2)| + C$

Trigonometric Integrals

30. $\int \cos^2 x dx = \frac{x}{2} + \frac{\sin 2x}{4} + C$
31. $\int \sin^2 x dx = \frac{x}{2} - \frac{\sin 2x}{4} + C$
32. $\int \sec^2 ax dx = \frac{1}{a} \tan ax + C$
33. $\int \csc^2 ax dx = -\frac{1}{a} \cot ax + C$
34. $\int \tan^2 x dx = \tan x - x + C$
35. $\int \cot^2 x dx = -\cot x - x + C$
36. $\int \cos^3 x dx = -\frac{1}{3} \sin^3 x + \sin x + C$
37. $\int \sin^3 x dx = \frac{1}{3} \cos^3 x - \cos x + C$

38. $\int \sec^3 x \, dx = \frac{1}{2} \sec x \tan x + \frac{1}{2} \ln |\sec x + \tan x| + C$
39. $\int \csc^3 x \, dx = -\frac{1}{2} \csc x \cot x - \frac{1}{2} \ln |\csc x + \cot x| + C$
40. $\int \tan^3 x \, dx = \frac{1}{2} \tan^2 x - \ln |\sec x| + C$
41. $\int \cot^3 x \, dx = -\frac{1}{2} \cot^2 x - \ln |\sin x| + C$
42. $\int \sec^n ax \tan ax \, dx = \frac{1}{na} \sec^n ax + C; n \neq 0$
43. $\int \csc^n ax \cot ax \, dx = -\frac{1}{na} \csc^n ax + C; n \neq 0$
44. $\int \frac{dx}{1 + \sin ax} = -\frac{1}{a} \tan \left(\frac{\pi}{4} - \frac{ax}{2} \right) + C$
45. $\int \frac{dx}{1 - \sin ax} = \frac{1}{a} \tan \left(\frac{\pi}{4} + \frac{ax}{2} \right) + C$
46. $\int \frac{dx}{1 + \cos ax} = \frac{1}{a} \tan \frac{ax}{2} + C$
47. $\int \frac{dx}{1 - \cos ax} = -\frac{1}{a} \cot \frac{ax}{2} + C$
48. $\int \sin mx \cos nx \, dx = -\frac{\cos(m+n)x}{2(m+n)} - \frac{\cos(m-n)x}{2(m-n)} + C; m^2 \neq n^2$
49. $\int \sin mx \sin nx \, dx = \frac{\sin(m-n)x}{2(m-n)} - \frac{\sin(m+n)x}{2(m+n)} + C; m^2 \neq n^2$
50. $\int \cos mx \cos nx \, dx = \frac{\sin(m-n)x}{2(m-n)} + \frac{\sin(m+n)x}{2(m+n)} + C; m^2 \neq n^2$

Reduction Formulas for Trigonometric Functions

51. $\int \cos^n x \, dx = \frac{1}{n} \cos^{n-1} x \sin x + \frac{n-1}{n} \int \cos^{n-2} x \, dx$
52. $\int \sin^n x \, dx = -\frac{1}{n} \sin^{n-1} x \cos x + \frac{n-1}{n} \int \sin^{n-2} x \, dx$
53. $\int \tan^n x \, dx = \frac{\tan^{n-1} x}{n-1} - \int \tan^{n-2} x \, dx; n \neq 1$
54. $\int \cot^n x \, dx = -\frac{\cot^{n-1} x}{n-1} - \int \cot^{n-2} x \, dx; n \neq 1$
55. $\int \sec^n x \, dx = \frac{\sec^{n-2} x \tan x}{n-1} + \frac{n-2}{n-1} \int \sec^{n-2} x \, dx; n \neq 1$
56. $\int \csc^n x \, dx = -\frac{\csc^{n-2} x \cot x}{n-1} + \frac{n-2}{n-1} \int \csc^{n-2} x \, dx; n \neq 1$
57. $\int \sin^m x \cos^n x \, dx = -\frac{\sin^{m-1} x \cos^{n+1} x}{m+n} + \frac{m-1}{m+n} \int \sin^{m-2} x \cos^n x \, dx; m \neq -n$
58. $\int \sin^m x \cos^n x \, dx = \frac{\sin^{m+1} x \cos^{n-1} x}{m+n} + \frac{n-1}{m+n} \int \sin^m x \cos^{n-2} x \, dx; m \neq -n$
59. $\int x^n \sin ax \, dx = -\frac{x^n \cos ax}{a} + \frac{n}{a} \int x^{n-1} \cos ax \, dx; a \neq 0$
60. $\int x^n \cos ax \, dx = \frac{x^n \sin ax}{a} - \frac{n}{a} \int x^{n-1} \sin ax \, dx; a \neq 0$

Integrals Involving $a^2 - x^2$; $a > 0$

61. $\int \sqrt{a^2 - x^2} \, dx = \frac{x}{2} \sqrt{a^2 - x^2} + \frac{a^2}{2} \sin^{-1} \frac{x}{a} + C$
62. $\int \frac{dx}{x\sqrt{a^2 - x^2}} = -\frac{1}{a} \ln \left| \frac{a + \sqrt{a^2 - x^2}}{x} \right| + C$
63. $\int \frac{dx}{x^2 \sqrt{a^2 - x^2}} = -\frac{\sqrt{a^2 - x^2}}{a^2 x} + C$
64. $\int x^2 \sqrt{a^2 - x^2} \, dx = \frac{x}{8} (2x^2 - a^2) \sqrt{a^2 - x^2} + \frac{a^4}{8} \sin^{-1} \frac{x}{a} + C$
65. $\int \frac{\sqrt{a^2 - x^2}}{x^2} \, dx = -\frac{1}{x} \sqrt{a^2 - x^2} - \sin^{-1} \frac{x}{a} + C$
66. $\int \frac{x^2}{\sqrt{a^2 - x^2}} \, dx = -\frac{x}{2} \sqrt{a^2 - x^2} + \frac{a^2}{2} \sin^{-1} \frac{x}{a} + C$
67. $\int \frac{dx}{a^2 - x^2} = \frac{1}{2a} \ln \left| \frac{x+a}{x-a} \right| + C$

Integrals Involving $x^2 - a^2$; $a > 0$

68. $\int \sqrt{x^2 - a^2} \, dx = \frac{x}{2} \sqrt{x^2 - a^2} - \frac{a^2}{2} \ln |x + \sqrt{x^2 - a^2}| + C$
69. $\int \frac{dx}{\sqrt{x^2 - a^2}} = \ln |x + \sqrt{x^2 - a^2}| + C$
70. $\int \frac{dx}{x^2 \sqrt{x^2 - a^2}} = \frac{\sqrt{x^2 - a^2}}{a^2 x} + C$
71. $\int x^2 \sqrt{x^2 - a^2} \, dx = \frac{x}{8} (2x^2 - a^2) \sqrt{x^2 - a^2} - \frac{a^4}{8} \ln |x + \sqrt{x^2 - a^2}| + C$
72. $\int \frac{\sqrt{x^2 - a^2}}{x^2} \, dx = \ln |x + \sqrt{x^2 - a^2}| - \frac{\sqrt{x^2 - a^2}}{x} + C$
73. $\int \frac{x^2}{\sqrt{x^2 - a^2}} \, dx = \frac{a^2}{2} \ln |x + \sqrt{x^2 - a^2}| + \frac{x}{2} \sqrt{x^2 - a^2} + C$
74. $\int \frac{dx}{x^2 - a^2} = \frac{1}{2a} \ln \left| \frac{x-a}{x+a} \right| + C$
75. $\int \frac{dx}{x(x^2 - a^2)} = \frac{1}{2a^2} \ln \left| \frac{x^2 - a^2}{x^2} \right| + C$

Integrals Involving $a^2 + x^2$; $a > 0$

76. $\int \sqrt{a^2 + x^2} dx = \frac{x}{2} \sqrt{a^2 + x^2} + \frac{a^2}{2} \ln(x + \sqrt{a^2 + x^2}) + C$
77. $\int \frac{dx}{\sqrt{a^2 + x^2}} = \ln(x + \sqrt{a^2 + x^2}) + C$
78. $\int \frac{dx}{x\sqrt{a^2 + x^2}} = \frac{1}{a} \ln \left| \frac{a - \sqrt{a^2 + x^2}}{x} \right| + C$
79. $\int \frac{dx}{x^2 \sqrt{a^2 + x^2}} = -\frac{\sqrt{a^2 + x^2}}{a^2 x} + C$
80. $\int x^2 \sqrt{a^2 + x^2} dx = \frac{x}{8} (a^2 + 2x^2) \sqrt{a^2 + x^2} - \frac{a^4}{8} \ln(x + \sqrt{a^2 + x^2}) + C$
81. $\int \frac{\sqrt{a^2 + x^2}}{x^2} dx = \ln|x + \sqrt{a^2 + x^2}| - \frac{\sqrt{a^2 + x^2}}{x} + C$
82. $\int \frac{x^2}{\sqrt{a^2 + x^2}} dx = -\frac{a^2}{2} \ln(x + \sqrt{a^2 + x^2}) + \frac{x\sqrt{a^2 + x^2}}{2} + C$
83. $\int \frac{\sqrt{a^2 + x^2}}{x} dx = \sqrt{a^2 + x^2} - a \ln \left| \frac{a + \sqrt{a^2 + x^2}}{x} \right| + C$
84. $\int \frac{dx}{(a^2 + x^2)^{3/2}} = \frac{x}{a^2 \sqrt{a^2 + x^2}} + C$
85. $\int \frac{dx}{x(a^2 + x^2)} = \frac{1}{2a^2} \ln \left(\frac{x^2}{a^2 + x^2} \right) + C$

Integrals Involving $ax \pm b$; $a \neq 0, b > 0$

86. $\int (ax + b)^n dx = \frac{(ax + b)^{n+1}}{a(n+1)} + C; n \neq -1$
87. $\int (\sqrt{ax + b})^n dx = \frac{2}{a} \frac{(\sqrt{ax + b})^{n+2}}{n+2} + C; n \neq -2$
88. $\int \frac{dx}{x\sqrt{ax - b}} = \frac{2}{\sqrt{b}} \tan^{-1} \sqrt{\frac{ax - b}{b}} + C$
89. $\int \frac{dx}{x\sqrt{ax + b}} = \frac{1}{\sqrt{b}} \ln \left| \frac{\sqrt{ax + b} - \sqrt{b}}{\sqrt{ax + b} + \sqrt{b}} \right| + C$
90. $\int \frac{x}{ax + b} dx = \frac{x}{a} - \frac{b}{a^2} \ln|ax + b| + C$
91. $\int \frac{x^2}{ax + b} dx = \frac{1}{2a^3} ((ax + b)^2 - 4b(ax + b) + 2b^2 \ln|ax + b|) + C$
92. $\int \frac{dx}{x^2(ax + b)} = -\frac{1}{bx} + \frac{a}{b^2} \ln \left| \frac{ax + b}{x} \right| + C$
93. $\int x\sqrt{ax + b} dx = \frac{2}{15a^2} (3ax - 2b)(ax + b)^{3/2} + C$
94. $\int \frac{x}{\sqrt{ax + b}} dx = \frac{2}{3a^2} (ax - 2b)\sqrt{ax + b} + C$
95. $\int x(ax + b)^n dx = \frac{(ax + b)^{n+1}}{a^2} \left(\frac{ax + b}{n+2} - \frac{b}{n+1} \right) + C; n \neq -1, -2$
96. $\int \frac{dx}{x(ax + b)} = \frac{1}{b} \ln \left| \frac{x}{ax + b} \right| + C$

Integrals with Exponential and Trigonometric Functions

97. $\int e^{ax} \sin bx dx = \frac{e^{ax}(a \sin bx - b \cos bx)}{a^2 + b^2} + C$
98. $\int e^{ax} \cos bx dx = \frac{e^{ax}(a \cos bx + b \sin bx)}{a^2 + b^2} + C$

Integrals with Exponential and Logarithmic Functions

99. $\int \frac{dx}{x \ln x} = \ln|\ln x| + C$
100. $\int x^n \ln x dx = \frac{x^{n+1}}{n+1} \left(\ln x - \frac{1}{n+1} \right) + C; n \neq -1$
101. $\int x e^x dx = x e^x - e^x + C$
102. $\int x^n e^{ax} dx = \frac{1}{a} x^n e^{ax} - \frac{n}{a} \int x^{n-1} e^{ax} dx; a \neq 0$
103. $\int \ln^n x dx = x \ln^n x - n \int \ln^{n-1} x dx$

Miscellaneous Formulas

104. $\int x^n \cos^{-1} x dx = \frac{1}{n+1} \left(x^{n+1} \cos^{-1} x + \int \frac{x^{n+1} dx}{\sqrt{1-x^2}} \right); n \neq -1$
105. $\int x^n \sin^{-1} x dx = \frac{1}{n+1} \left(x^{n+1} \sin^{-1} x - \int \frac{x^{n+1} dx}{\sqrt{1-x^2}} \right); n \neq -1$
106. $\int x^n \tan^{-1} x dx = \frac{1}{n+1} \left(x^{n+1} \tan^{-1} x - \int \frac{x^{n+1} dx}{x^2 + 1} \right); n \neq -1$
107. $\int \sqrt{2ax - x^2} dx = \frac{x-a}{2} \sqrt{2ax - x^2} + \frac{a^2}{2} \sin^{-1} \left(\frac{x-a}{a} \right) + C; a > 0$
108. $\int \frac{dx}{\sqrt{2ax - x^2}} = \sin^{-1} \left(\frac{x-a}{a} \right) + C; a > 0$

DERIVATIVES

General Formulas

$$\frac{d}{dx}(c) = 0$$

$$\frac{d}{dx}(f(x) + g(x)) = f'(x) + g'(x)$$

$$\frac{d}{dx}(f(x)g(x)) = f'(x)g(x) + f(x)g'(x)$$

$$\frac{d}{dx}(x^n) = nx^{n-1}, \text{ for real numbers } n$$

$$\frac{d}{dx}(cf(x)) = cf'(x)$$

$$\frac{d}{dx}(f(x) - g(x)) = f'(x) - g'(x)$$

$$\frac{d}{dx}\left(\frac{f(x)}{g(x)}\right) = \frac{g(x)f'(x) - f(x)g'(x)}{(g(x))^2}$$

$$\frac{d}{dx}(f(g(x))) = f'(g(x)) \cdot g'(x)$$

Trigonometric Functions

$$\frac{d}{dx}(\sin x) = \cos x$$

$$\frac{d}{dx}(\tan x) = \sec^2 x$$

$$\frac{d}{dx}(\sec x) = \sec x \tan x$$

$$\frac{d}{dx}(\cos x) = -\sin x$$

$$\frac{d}{dx}(\cot x) = -\csc^2 x$$

$$\frac{d}{dx}(\csc x) = -\csc x \cot x$$

Inverse Trigonometric Functions

$$\frac{d}{dx}(\sin^{-1} x) = \frac{1}{\sqrt{1-x^2}}$$

$$\frac{d}{dx}(\tan^{-1} x) = \frac{1}{1+x^2}$$

$$\frac{d}{dx}(\sec^{-1} x) = \frac{1}{|x|\sqrt{x^2-1}}$$

$$\frac{d}{dx}(\cos^{-1} x) = -\frac{1}{\sqrt{1-x^2}}$$

$$\frac{d}{dx}(\cot^{-1} x) = -\frac{1}{1+x^2}$$

$$\frac{d}{dx}(\csc^{-1} x) = -\frac{1}{|x|\sqrt{x^2-1}}$$

Exponential and Logarithmic Functions

$$\frac{d}{dx}(e^x) = e^x$$

$$\frac{d}{dx}(\ln |x|) = \frac{1}{x}$$

$$\frac{d}{dx}(b^x) = b^x \ln b$$

$$\frac{d}{dx}(\log_b |x|) = \frac{1}{x \ln b}$$

Hyperbolic Functions

$$\frac{d}{dx}(\sinh x) = \cosh x$$

$$\frac{d}{dx}(\tanh x) = \operatorname{sech}^2 x$$

$$\frac{d}{dx}(\operatorname{sech} x) = -\operatorname{sech} x \tanh x$$

$$\frac{d}{dx}(\cosh x) = \sinh x$$

$$\frac{d}{dx}(\coth x) = -\operatorname{csch}^2 x$$

$$\frac{d}{dx}(\operatorname{csch} x) = -\operatorname{csch} x \coth x$$

Inverse Hyperbolic Functions

$$\frac{d}{dx}(\sinh^{-1} x) = \frac{1}{\sqrt{x^2+1}}$$

$$\frac{d}{dx}(\tanh^{-1} x) = \frac{1}{1-x^2} \quad (|x| < 1)$$

$$\frac{d}{dx}(\operatorname{sech}^{-1} x) = -\frac{1}{x\sqrt{1-x^2}} \quad (0 < x < 1)$$

$$\frac{d}{dx}(\cosh^{-1} x) = \frac{1}{\sqrt{x^2-1}} \quad (x > 1)$$

$$\frac{d}{dx}(\coth^{-1} x) = \frac{1}{1-x^2} \quad (|x| > 1)$$

$$\frac{d}{dx}(\operatorname{csch}^{-1} x) = -\frac{1}{|x|\sqrt{1+x^2}} \quad (x \neq 0)$$

FORMS OF THE FUNDAMENTAL THEOREM OF CALCULUS

Fundamental Theorem of Calculus	$\int_a^b f'(x) dx = f(b) - f(a)$
Fundamental Theorem for Line Integrals	$\int_C \nabla f \cdot d\mathbf{r} = f(B) - f(A)$ (A and B are the initial and final points of C .)
Green's Theorem	$\iint_R (g_x - f_y) dA = \oint_C f dx + g dy$ $\iint_R (f_x + g_y) dA = \oint_C f dy - g dx$
Stokes' Theorem	$\iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} dS = \oint_C \mathbf{F} \cdot d\mathbf{r}$
Divergence Theorem	$\iiint_D \nabla \cdot \mathbf{F} dV = \iint_S \mathbf{F} \cdot \mathbf{n} dS$

FORMULAS FROM VECTOR CALCULUS

Assume $\mathbf{F}(x, y, z) = f(x, y, z)\mathbf{i} + g(x, y, z)\mathbf{j} + h(x, y, z)\mathbf{k}$, where f, g , and h are differentiable on a region D of $\mathbb{R}^3$.

Gradient: $\nabla f(x, y, z) = \frac{\partial f}{\partial x}\mathbf{i} + \frac{\partial f}{\partial y}\mathbf{j} + \frac{\partial f}{\partial z}\mathbf{k}$

Divergence: $\nabla \cdot \mathbf{F}(x, y, z) = \frac{\partial f}{\partial x} + \frac{\partial g}{\partial y} + \frac{\partial h}{\partial z}$

Curl: $\nabla \times \mathbf{F}(x, y, z) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ f & g & h \end{vmatrix}$

$\nabla \times (\nabla f) = \mathbf{0} \quad \nabla \cdot (\nabla \times \mathbf{F}) = 0$

$\mathbf{F}$ conservative on $D \Leftrightarrow \mathbf{F} = \nabla \varphi$ for some potential function φ

$\Leftrightarrow \oint_C \mathbf{F} \cdot d\mathbf{r} = 0$ over closed paths C in D

$\Leftrightarrow \int_C \mathbf{F} \cdot d\mathbf{r}$ is independent of path for C in D

$\Leftrightarrow \nabla \times \mathbf{F} = \mathbf{0}$ on D
